<tbody>
<tr>
<td><strong>Course Redesign Institute (Summer 2015):</strong> How do we redesign our course? What are the outcomes we want students to achieve? What instruction will be provided to students? How will we know that they learned what we wanted them to learn?</td>
<td><strong>Powerpoint 3-46</strong></td>
</tr>
<tr>
<td><strong>Teaching that supports diverse learners (June 2015):</strong> What is <em>inclusive pedagogy</em>? How can we easily adjust instruction to embrace diverse learner experiences and approaches to learning that improve student success? What do the data show about culture-based differences in learning and about instruction that reduces achievement gaps?</td>
<td><strong>Handbook 47-154</strong></td>
</tr>
<tr>
<td><strong>Building learning-to-learn habits of mind into your curriculum (July 2015):</strong> Do your students know how to develop competency in your course? How can you develop exercises and activities that improve your students’ metacognition and reasoning abilities to become better learners?</td>
<td>166-182</td>
</tr>
<tr>
<td><strong>Starting the semester- Making sure learners are on board with your redesign (early August 2015):</strong> Are you ready to effectively introduce your redesigned course and expectations on the first day of class? How do you get students to value deep learning in your redesigned course? How do you get students to “buy into” the responsibility it takes to actively learn, not passively listen, in class?</td>
<td>183-205</td>
</tr>
<tr>
<td><strong>Constructing effective multiple choice tests (September 2015):</strong> Do you know that some studies conclude that most instructor-designed multiple-choice tests are flawed in ways that diminish student achievement regardless of their knowledge? Do you know the pitfalls to avoid when constructing a test? Do you want to improve formative and summative assessment of higher-order learning with your multiple-choice questions?</td>
<td>206-221</td>
</tr>
<tr>
<td><strong>Learning from each other – A different way to think about classroom observation (October 2015):</strong> Have you ever considered visiting a colleague’s class to learn about teaching from observing how she or he teaches? How can your redesign effort be improved by learning from each other’s classroom practices? How can you maximize your learning during a classroom observation?</td>
<td>222-246</td>
</tr>
<tr>
<td><strong>What did my students think? Building surveys for student feedback (November 2015):</strong> Is it important to know what students think about your redesigned course? How can you find out what’s working and not working from the learners’ perspective? How can you use this feedback as input to continuous improvement of your redesigned course?</td>
<td>247-262</td>
</tr>
<tr>
<td><strong>Debriefing and looking ahead – What did we learn during the fall? (early December 2015):</strong> What changes do we need to make for next semester? What information will be used to trigger adjustments? How will the team plan the adjustments? What milestones and goals did we meet? What milestones and goals do we still have?</td>
<td>263-265</td>
</tr>
<tr>
<td><strong>Why aren’t my students learning? (late January 2016):</strong> Are you blaming your students for low achievement? What might be happening? How might you assist students’ achievement of outcomes in your course?</td>
<td>266-284</td>
</tr>
<tr>
<td><strong>Checking your alignment (February 2016):</strong> Are your outcomes, learning activities, and assessments appropriately aligned? Do you provide scaffolding opportunities to raise students from low-level thinking to high-level thinking?</td>
<td>285-292</td>
</tr>
<tr>
<td><strong>Closing the Loop: How to evaluate your accomplishments (March 2016):</strong> Did the redesign project achieve its goals? What information will you need to evaluate project success? How will you obtain that information? [Separate meetings scheduled with each team]</td>
<td>293</td>
</tr>
<tr>
<td><strong>Strategies for expanding and sustaining your redesign project (April 2016):</strong> How are you planning to sustain and expand your redesign after this semester? What is a community of practice (CoP)? How can a CoP provide a foundation for your continued success? How do you initiate a CoP among the teachers of the course?</td>
<td>294-314</td>
</tr>
<tr>
<td>*Featuring an example Active Learning Handbook written by Joe Ho for Chemistry 121/122 Faculty.</td>
<td>315-358</td>
</tr>
<tr>
<td><strong>Looking back and planning forward (team meetings in late May or early June 2016):</strong> What is the team’s plan for revising elements of the redesign before the upcoming fall semester? Who needs to be included as the project implementation expands? What tasks will team members undertake during the summer? How can you disseminate what you’ve learned during the redesign?</td>
<td>359-360</td>

STEM Gateway
Course Redesign Teaching Professional Development Program:
Course Redesign Institute

1. ... explain the motive for redesigning the course
2. ... define measurable learning outcomes for the course
3. ... identify pedagogical/curricular changes that could address problems that motivated redesign
4. ... develop criteria for selecting, creating, and integrating specific tools, assignments, and assessments to achieve learning outcomes
5. ... create a course curriculum of teachable units that integrate in-class and out-of-class learning
6. ... construct a plan with a timeline, milestones, and goals for partial to full implementation of redesign, which identifies additional STEM Gateway consultation and other resource needs
7. ... develop an assessment plan that tracks student achievement of outcomes and affect and instructor affect towards redesign efforts
8. ... use data to inform modification of redesign plans including a process for determining when modifications should be made and who will make modifications
9. ... create a plan for sustaining the redesign and expanding to include all instructors of the course
Getting into a teaching and learning frame of mind...

Choose one image that describes your perceptions of what happens in undergraduate courses in your field.

Then – introduce yourself and very briefly (1 minute) explain how this image is a metaphor or analogy for …

“How I perceive what happens in a course”

Part I: Warming Up: The Instructional Change Process

Part I outcomes:

You will be able to ...

... explain the components of a course, including the roles of teachers, learners, subject matter and intended course outcomes

... describe the process of instructional change

What is a course?

Curriculum
- Content
- Order of topics
- Relationship to other courses

Pedagogy
- Teaching methods/strategies
- Learner activities

Learner Engagement
- Motivation
- Prior knowledge and experiences

The Course

Learning Outcomes

(p. 5)
Effective course design *integrates* activities that are formed around these questions:

- What should they learn? *(Outcomes)*
- How should they learn it? *(Instruction)*
- How will we know they learn it? *(Assessment)*

(Outcomes) (Instruction) (Assessment)

Let’s ponder a case-study in teaching and learning

How was the difference in learning related to the difference in teaching?

We will revisit this question.

---

**STEM Gateway Course Redesign**

Projects draw on the fundamental role of faculty to change student outcomes

“... student success, however it is defined and measured, must have at its core success in individual classes. Though student success is indeed everyone’s business, it is the business of faculty in particular.”

*Tinto, V., and Pusser, B., 2006, Moving from theory to action: Building a model of institutional action for student success*

“The biggest and most long-lasting reforms of undergraduate education will come when individual faculty or small groups of instructors adopt the view of themselves as reformers, within their immediate sphere of influence, the classes they teach every day.”

*K. Patricia Cross, Professor of Higher Education, University of California, Berkeley; Trustee, Carnegie Foundation for the Advancement of Teaching*
Clear the fog with ...

Clear objectives... outcomes of the journey we’re beginning

**STEM Gateway Professional Development Program**

*Designing Instructional Change to Improve Student Success*

Part II: What Motivates You and Your Learners?

**Part II outcomes:**

You will be able to ...

... explain why STEM-course redesign is important to student success

... articulate a vision for their redesign project

... use expectancy-value motivation as a foundation for engaging learners
Why Redesign?

**Image at** https://s-media-cache-ak0.pinimg.com/236x/a4/20/b0/a420b081f3bcc9d98e802f9d1030b3ab.jpg

</tbody>
</table>

Summary of declared and aspired majors, UNM Fall 2006 freshmen cohort

Data from UNM Office of Institutional Analytics
“Killer courses” are significant challenges to student persistence

Courses enrolling more than 100 students and where >20% do not complete with a C or higher grade

- 81 courses with 27,858 “enrollments”
- Account for 1/3rd of undergraduate SCH
- 8846 “enrollments” did not succeed in these courses

Data from UNM Office of Institutional Analytics

STEM courses are prominent entries on the “Killer course” list

Physical/natural science, math, engineering
- Non-STEM

Teaching quality is the strongest concern of STEM majors. Faculty instructional and curricular choices are the reasons that students leave STEM majors.

Reason for switching to non-STEM major
- Concern for students who switched
- Concern for students who did not switch

(Seymour and Hewitt, 1997, Talking About Leaving)

Which of these aspects of pursuing a STEM degree is of greatest concern to undergraduate STEM majors?

A. Tests in STEM courses are too hard.
B. Poor teaching in STEM courses
C. The rigor of STEM courses compared to non-STEM classes
D. Course curriculum for STEM degrees is overwhelming

Data from UNM Office of Institutional Analytics
Why Redesign?

Activity

7 minutes

Review your objectives and the “significance” part of your proposal. Summarize the factors that motivate your team to redesign the course.

With your team, construct a vision statement.

(p. 11)

What motivates students to learn?

Write

Pair

Share

(p. 12)

Achievement motivation relies on value and expectancy

A goal that I value ...

... and a belief that I can make it!

(p. 13)

What We Value

Underlies What We Do

And How We Do It

Part III: What Should Students Learn?  
Defining Course-Level Outcomes

Part III outcomes:

You will be able to ...

... define SMART student learning outcomes for their course

... analyze the cognitive processes and knowledge acquisition specified by a SMART outcome

(p. 14)

Effective course design and teaching builds courses backwards from where we expect students to finish.

“If you don’t know where you’re going, chances are you will end up somewhere else.”

Yogi Berra
When using backwards design, begin with asking:

What should they learn? AKA Student Learning Outcomes

How should they learn it?

How will we know that they learn it?

Outcomes should exist at multiple, connected levels

Degree-level outcomes

Course-level outcomes

Teachable Unit-Level outcomes

Student learning outcomes (objectives) focus on the learner.

What students will know and be able to do, or value as a result of having completed the course

Student learning outcomes are SMART.

(p. 15)

Specific

Measurable

Attainable for target audience

Relevant and results-oriented

Targeted to the learner and the desired level of learning
Let's evaluate: *What do you think of the quality of these outcomes?*

(p. 16)
- I want to encourage writing fluency and confidence.
- In this course students will understand that poverty is a complex issue.
- Students will be able to identify rocks and minerals.
- Students will solve linear equations in one variable.
- Students will be able to apply their knowledge of statistics to analyze reports and claims in the popular press.

---

Bloom's taxonomy describes the types of thinking and learning we want to achieve.

<table>
<thead>
<tr>
<th>Cognitive process</th>
<th>What the learner does</th>
<th>Knowledge Dimension</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create</td>
<td>Brings together parts to form a new whole or solve a problem that requires new creative thinking.</td>
<td>Factual</td>
</tr>
<tr>
<td>Evaluate</td>
<td>Judges the value of something by application of criteria, processes, or standards.</td>
<td>Conceptual</td>
</tr>
<tr>
<td>Analyze</td>
<td>Identifies how parts relate to one another or to a larger structure or purpose; considers available evidence to reach a conclusion, inference or generalization.</td>
<td>Procedural</td>
</tr>
<tr>
<td>Apply</td>
<td>Use methods, concepts, principles, theories in new situations; solve realistic problems that require the identification of issues and use of appropriate generalizations and skills.</td>
<td>Metacognitive</td>
</tr>
<tr>
<td>Understand</td>
<td>Constructs meaning by explaining, classifying, comparing, summarizing.</td>
<td>Factual</td>

<tr>
<td>Remember</td>
<td>Recalls or recognizes information: facts, definitions, generalizations.</td>
<td>Conceptual</td>
</tr>
</tbody>
</table>

Bloom's taxonomy also considers different types of knowledge that are acquired

<table>
<thead>
<tr>
<th>Knowledge type</th>
<th>Knowledge gained:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Factual</td>
<td>Basic elements (e.g., terms, people, formulas) that learners must know to be acquainted with a discipline or solve problems in the discipline.</td>
</tr>
<tr>
<td>2. Conceptual</td>
<td>The interrelationships among the basic elements within a larger structure that enables the elements to function together (e.g., classifications, principles, theories, models, structures).</td>
</tr>
<tr>
<td>3. Procedural</td>
<td>How to do something — methods of inquiry, algorithms, techniques — along with criteria for when to use appropriate procedures. Knowledge of the nature of a cognitive task in relation to one's own cognitive abilities, knowledge of how and when to effectively use cognitive strategies. “knowing what you do and do not know”</td>
</tr>
<tr>
<td>4. Metacognitive</td>
<td>Knowledge of the nature of a problem or of the nature of a cognitive task in relation to one’s own cognitive abilities, knowledge of how and when to effectively use cognitive strategies.</td>
</tr>
</tbody>
</table>

---

Knowledge Dimension

<table>
<thead>
<tr>
<th>Cognitive Process Dimension</th>
<th>Knowledge Type</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Where do these outcomes plot?

(p. 19)

Students will be able to:
1. ... solve linear equations in one variable.
2. ... apply their knowledge of statistics to analyze reports and claims in the popular press.
3. ... identify rocks and minerals.
4. ... analyze rock samples from a locality and interpret the geologic processes that occurred.
Outcomes should exist at multiple, connected levels

- Degree-level outcomes
- Course-level outcomes
- Teachable Unit-level outcomes

“Bloom” your course outcomes on the wall charts (also p.20)

Activity

Match each outcome to Bloom dimensions

Place non-SMART or otherwise problematic objectives on the side

Room for improvement? Edit as you go and consider adding more high-order outcomes while reserving low-order one for class-level, rather than course-level, outcomes.

Part IV: What Should Students Learn? Defining Teachable-Unit-Level Outcomes

Part IV outcomes:

You will be able to ...

- define a teachable unit as an explicit, outcomes-driven module for a course
- connect teachable-unit-level outcomes to course-level outcomes as a process of scaffolded learning

(p. 22)
Throughout the institute, you will build a teachable unit.

Instructional materials that enclose the activities, assignments, and assessments within a time-defined part of the course that are designed to achieve learner mastery of an essential concept and/or a course outcome.

May be a plan for one class period, one week, or some other part of the whole course.

Is constructed so that other instructors could execute the unit.

When starting a teachable unit, begin with answering:

Teachable Unit Guide (p. 94 or Word file)

Questions 1 and 2

With your team/partner, define and Bloom your teachable unit outcomes

(What should students learn?)

30 minutes

Congratulations!

You have just completed a teachable-unit milestone

3. What are the essential learning outcomes for the unit? (These outcomes could be specific to your course but may include generic learning outcomes for the course level/area.) After copying the unit, check off that you assigned students or mastered each item and assessed their learning.

Teachable Unit Outcomes Related Course Outcomes

Before moving on... "Bloom" each unit-level outcome and related course-level outcome on your course outline.
Part V: Where Learning Begins (p. 24)

Part V outcomes:

You will be able to ...

... describe the fundamental learning centers in the brain ... begin an analysis of how students’ prior knowledge affects learning in the targeted course

What Does it Mean “to Learn?”

Write answers to these questions in the spaces provided on page 25

• What is your definition of “learning”?

• What is your definition of “teaching”?

“It dawned on me about two weeks into the first year that it was not teaching that was taking place in the classroom, but learning.”

Pop star Sting, reflecting upon his early career as a teacher

right image at: https://lh3.googleusercontent.com/-ZH99eX3woyo/T7UbQe69rAI/AAAAAAAARug/QxdfMxsW1O0/w426-h331/teachlearn.jpg

center photo courtesy of UNM

Left photo courtesy of UNM

Right photo courtesy of UNM
Example definitions of teaching and learning

“Learning is the stabilization, through repeated use, of certain appropriate and desirable synapses in the brain.”

“Teaching means any activity that has the conscious intention of, and potential for, facilitating learning in another person.”

R. Leamnson, 1999, Thinking about teaching and learning

The most effective learning triggers all learning centers in the brain

Actions: writing, discussing, experimenting, testing

Integration: “making sense”, new understanding, manipulating working memory

Integration: long-term memory: connection to what is already known, forming new neural networks through repetition, elaboration, and sleep

Sensory input: sight and sound; concrete experience

(p. 26)

Learning starts with what is already known … or thought to be known

“If I had to reduce all of educational psychology to just one principle, I would say this: The most important single factor influencing learning is what the learner already knows. Ascertain this and teach him accordingly.”

David Ausubel

Knowledge is associative—it is linked to prior mental models and cognitive structures

Teaching is not about pouring knowledge into the learners’ empty brains

(p. 27)

How People Learn, National Research Council, 2000

Chapter 2 Active Learning

Scientific Teaching
Knowledge is associative—it is linked to prior mental models and cognitive structures ...

... and can include prior misconceptions.

Knowledge is associative—it is linked to prior mental models and cognitive structures ...

... and can include prior misconceptions.

If a learner’s initial misunderstanding is not engaged he or she may fail to grasp new concepts, correct concepts, or both.

“It ain’t what you don’t know that gets you into trouble. It’s what you know for sure that just ain’t so.”
- Mark Twain

Knowledge is associative—it is linked to prior mental models and cognitive structures ...

Ice is floating in a glass of water that is filled to the rim. When the ice melts, the water level will ...

A. ... rise, so that the water overflows the rim
B. ... stay the same, so that the water level remains at the rim
C. ... fall, so that the water level drops below the rim
D. ... depend on the density of the ice
“Any solid lighter than a fluid will, if placed in the fluid, be so far immersed that the weight of the solid will be equal to the weight of the fluid displaced.”

Archimedes of Syracuse, c. 225 BCE, *Floating Bodies*

**Ice**

Density is 90% of the density of freshwater, so it floats with 90% of its volume submerged.

Without the ice, the water level is lower, because a weight of water equal to that of the ice cube had been displaced.

Based on a 2200-year-old physics principle … … the water level will be unchanged

Floating sea ice and icebergs in the Arctic Ocean are melting at faster rates during the summer than they form during the winter. As a result

…

A. sea level will rise
B. sea level will stay the same
C. sea level will fall
D. sea level change will depend on the density of the ice

Maps at: http://nsidc.org/

**Which freezes more readily?**

A. Fresh water
B. Sea water
C. There is no difference
Peer instruction is an evidence-based use of clickers to expose weak prior knowledge while promoting and assessing learning.

Activity

The Impact of Learner Prior Knowledge for Learning from Your Teachable Unit

Complete the worksheet on p. 95 with your redesign team.

Part VI: How will Students Learn?

The Science Behind Scientific Teaching

Part VI outcomes:

You will be able to ...

... apply cognitive psychology principles to determine the likely efficacy of instructional approaches

... recognize learning along the interactive-passive continuum

... explain to a colleague why active learning generates greater learning achievements than traditional lecture

Write

Pair

Share

Describe in your own words...

What is active learning?
Classroom active learning includes any activity that "involves students in doing things and thinking about the things they are doing".

(Bonwell and Eison, 1991, Active learning: Creating excitement in the classroom)

"Active learning increases student performance in science, engineering, and mathematics"
Scott Freeman and 6 others, 2014, Proceedings of the National Academy of Sciences

Failure rates under traditional lecturing (avg. 33.8%) increase by 55% over the rates observed under active learning (21.8%).

"If the experiments analyzed here had been conducted as randomized controlled trials of medical interventions, they may have been stopped for benefit—meaning that enrolling patients in the control condition might be discontinued because the treatment being tested was clearly more beneficial."

(Bar chart showing number of studies with increased or decreased failure rates)

Why do you or would you use active learning? Why don’t you or wouldn’t you use active learning?

What intrigues us the most about these types of research results...

What do you think the percentage point decrease in failure rate with active learning?
An implementation problem?

If possible – observe the technique being used

Not all active-learning strategies are equal …

… so they won’t all lead to the same amount of learning.

If all you know is a recipe …

… and it fails to produce the desired result...

… how can you figure out what went wrong and what to do about it?

Effective design and diagnosis of learning activities requires some level of knowledge of how learning works

Coming up:
• A few key concepts from cognitive psychology
• An approach for “rating” active-learning instructional elements
Returning to our case-study in teaching and learning

Can you explain the learning differences in the physics classes?

*Deslauriers et al., 2011, Improved learning in a large-enrollment physics class, Science, 332: 862*

Note-taking helps to encode memories

*Skeletal notes (p. 33)*

There are three, inter-related memory-forming processes

- **Encoding**: Incoming stimulus converted into a “memory trace”
- **Re-consolidation**: Reorganization and stabilization of memory traces; connections to past experiences and stored knowledge
- **Retrieval**: Drawing on memories in new situations

Active learning includes favorable encoding that is consolidated and retrievable

1. **Selecting**: Attending to relevant aspects of the information coming into our cognitive system through sensory inputs and actions
Active learning includes favorable encoding that is consolidated and retrievable

1. Selecting

2. Elaboration: interpreting new information, connecting it with other information, and mulling it over.

Which of these approaches do you think generates the greater learning?

A. Learner attempts to solve problems and/or answer questions about a new topic before the instructor explains it in class.

B. Learner attempts to solve problems and/or answer questions about a new topic after the professor explains it in class.

The roles of constructed and transmitted knowledge examined through transfer of understanding to explain cases

- Read/summarize text about cases
- Lecture about the phenomenon
- Make predictions about a new case
- Analyze the cases
- Lecture about the phenomenon
- Make predictions about a new case

Expert explanation after novice construction of knowledge leads to better learning transfer

Active learning includes favorable encoding that is consolidated and retrievable

1. Selecting
2. Elaboration

3. Generation effect: Memories are more strongly encoded when knowledge is partly or wholly constructed in one’s mind rather than only received.

There are three, inter-related memory-forming processes

- Encoding
  Incoming stimulus converted into a “memory trace”

- Consolidation
  Reorganization and stabilization of memory traces; connections to past experiences and stored knowledge

- Retrieval
  Drawing on memories in new situations

Which strategy do you think is most effective for consolidating memories of new concepts or procedures?

A. Spaced learning in short time increments across a long time interval.

B. Massed learning in a single, long learning session
Learning retention and transfer is improved by spaced rather than massed study

Students were taught a microsurgical procedure in either:

- 1, 8-hour session (massed)
- 4, 2-hour weekly sessions (spaced)

<table>
<thead>
<tr>
<th>Prior knowledge</th>
<th>End of training: Test at</th>
<th>Retention (1 week)</th>
<th>Transfer (1 week)</th>
<th>Live, anesthetized rat:</th>
<th>Score</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test before training</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Moulton et al., 2006; Teaching surgical skills: What kind of practice makes perfect? Annals of Surgery, 244(3): 400-409

Consolidation (and re-consolidation) is affected by the timing of the encoding process

1. Selecting
2. Elaboration
3. Generation effect

4. Spacing: Repetition, with time in between learning occurrences, better consolidates long-term memory for retrieval.

There are three, inter-related memory-forming processes

- Encoding: Incoming stimulus converted into a “memory trace”
- Consolidation: Reorganization and stabilization of memory traces; connections to past experiences and stored knowledge
- Retrieval: Drawing on memories in new situations

Which of these approaches do you think will most benefit students to prepare for an exam?

A. Providing students a review sheet related to the exam topics.
B. Quizzing the students about the exam topics.
Testing, and learner self-explanation are critical to effective, long-term learning

Students ...

a) Received lecture instruction on 4 topics,
b) received one of 4 of four weekly learning sessions following each topic, and
c) were assessed with a knowledge-application test on the four topics, 6 months later.

Retrieval is part of learning as well as testing

1. Selecting
2. Elaboration; including self-explanation
3. Generation effect
4. Spacing

5. Testing effect: Every time a memory is retrieved and utilized it is changed and reconsolidated in long-term memory

Effortful recall or practice helps to integrate learning into mental models, in which sets of inter-related ideas are fused into a meaningful whole that can be used in later situations

There are three, inter-related memory-forming processes

- Encoding: Incoming stimulus converted into a “memory trace”
- Consolidation: Reorganization and stabilization of memory traces; connections to past experiences and stored knowledge
- Retrieval: Drawing on memories in new situations

Effective design and diagnosis of learning activities requires some level of knowledge of how learning works

Coming up:
- A few key concepts from cognitive psychology
  - An approach for “rating” active-learning instructional elements
Active learning is about to be used differently than was previously defined.

The ICAP model differentiates learning activities on the basis of the learner’s overt behaviors.

The ICAP model demonstrates that not all learning activities generate the same depth of learning.

ICAP hypothesis is supported by learning-achievement data from an introductory materials science course.
ICAP the following workshop examples

1. Each participant reads part of a book and answers accompanying guiding reading questions individually.
2. Each participant listens to a lecture and elaborates on the skeleton notes about Selecting, Elaborating, Generation Effect, Spacing, and Testing Effect provided in their workbook during the workshop.
3. Each participant listens to the facilitator explain where learning takes place in the brain, and the three components of memory formation.
4. Each participant answers a clicker question and then discusses and debates answers with colleagues. Answers are resubmitted via clickers.

Part VII: Where does learning take place?

Part VII outcome:

You will be able to...

... sketch the learning-activity sequence as a framework for building a teachable unit

Sometimes, the focus is on reproducing a single activity (dish)

And... there are plenty of "dish-by-dish cookbooks" for educators

The most effective teacher with active learning is a chef...

... who prepares multiple-course meals
Very limited time is spent with students physically present in-class.

To maximize our time, what could we provide as:

### Pre-class Preparation

<table>
<thead>
<tr>
<th>Preparation before class</th>
<th>Follow-up after class</th>
</tr>
</thead>
</table>

### In-class Learning

- **Interactive learning during and inside class**

### After-class Learning

- Monitoring and elaborating on learning after and outside of class

---

**Muddy Point Question**

Before leaving, take 10 minutes to answer -

What ideas or application of concepts discussed today remain unclear?

Or

What ideas or application of concepts were most interesting? Why?

STEM Gateway Professional Development Program
Designing Instructional Change to Improve Student Success

Focus for now...

Instructional Change Process

Materials: What is the rationale for undertaking your course?

Approach: What should students learn?

Implementation: What will students do to support their learning? What learning activities are employed? What resources are needed?

Assessment: What is the evidence that the learning is occurring? How can the learning outcomes being measured? How are assessments administered?

Develop: What will learners do in order to achieve the objectives? What will be the ingredients of the teachable units? How will learning be assessed in each unit?

Instructional Change Process

Focus for now...

Instructional Change Process

Materials: What is the rationale for undertaking your course?

Approach: What should students learn?

Implementation: What will students do to support their learning? What learning activities are employed? What resources are needed?

Assessment: What is the evidence that the learning is occurring? How can the learning outcomes being measured? How are assessments administered?

Develop: What will learners do in order to achieve the objectives? What will be the ingredients of the teachable units? How will learning be assessed in each unit?
Part VIII: Building a Teachable Unit – Selecting Pedagogy and Content for Student Success

Part VIII outcomes:
You will be able to …

…draft peer instruction Q & A prompts
... create teachable units for your redesigned course using the learning activity sequence
... analyze a teachable unit to assure alignment of learning activities with learning outcomes

Start where you are at, now, and set a goal for enhancing learning

“From Questions to Concepts”

Interactive Teaching DVD: Promoting Better Learning Using Peer Instruction and Just-In-Time Teaching

Debriefing … “From Questions to Concepts”

How is the learning activity sequence being applied?
Debriefing … “From Questions to Concepts”  p. 50

How are students’ misconceptions and prior knowledge being addressed?

Debriefing … “From Questions to Concepts”

Why is it important to make learning “visible”?

Debriefing … “From Questions to Concepts”

Where does pre-class work plot on the ICAP framework? Where does in-class work plot on the ICAP framework?

Debriefing … “From Questions to Concepts”

What was the role of peer instruction for both promoting and assessing learning?
Draft 3 peer instruction questions with accompanying answers.

*Questions must be connected to the outcomes for your teachable unit!*

Part VIII: Building a Teachable Unit – Selecting Pedagogy and Content for Student Success

Part VIII outcomes:

You will be able to …

... create teachable units for your redesigned course using the learning activity sequence

... analyze a teachable unit to assure alignment of learning activities with learning outcomes

...draft peer instruction Q & A prompts

Effective course design integrates activities that are formed around these questions:

- What should they learn? (Outcomes)
- How should they learn it? (Instruction)
- How will we know they learn it? (Assessment)

“It is the one who does the work who does the learning”

Terry Doyle, 2008, Helping students learn in a learner-centered environment

“Don’t re-teach yourself. Standing at the front of the room talking and writing on the board is you re-enforcing what you know. Engage your students… we need to work with the material, talk about it, think about it, not listen to you all of the time.”

- UNM student panelist, “Improving Native American Student Success”
Building a teachable unit focuses on questions about what learners do

What should learners know/be able to do, at the end of the class session?

What should learners do in class to master the objective? How will this activity benefit from peer and instructor interaction?

How should learners prepare themselves before class? What reading, video, animation, simulation, etc. introduces the content concepts most effectively?

How should learners practice the expected thinking and monitor learning after class?

Within the learning activity sequence...

… students engage with learning the content during class time with peer and instructor influence, …

The learning activity sequence structures what is learned both in and out of class

Learning Activity Sequence

Learning Before Class

First contact with content before and outside of class

Interactive learning during and inside class

Learning During Class

Learning After Class

Monitoring and elaborating on learning after and outside of class

Assessing learning

Within the learning activity sequence...

… students engage with learning the content during class time with peer and instructor influence, …

… which means that students must be prepared by making first contact with (and thinking about) content prior to class.
You may have heard these concepts as “flipped learning.”

**Building a Teachable Unit**

Chapter 5 of *Scientific Teaching*. P. 97-104

Complete the worksheet with your redesign team.

Chapter 5
*Scientific Teaching*. p. 83

Congratulations! You have just completed a milestone.

**Part IX:** Building a Teachable Unit – Assessing What students are Learning

Part IX outcomes:

- You will be able to ...
  - develop formative and summative assessments of learning outcomes
  - analyze assessments to assure alignment with learning outcomes and learning activities

p. 56
Measuring learning gains by...

... pre and post testing with a concept inventory and a knowledge survey

Retake the CI/KS
Individually, please!
The handbook has more references about concept inventories and knowledge surveys

Effective course design *integrates* activities that are formed around these questions:

- What should they learn? (Outcomes)
- How should they learn it? (Instruction)
- How will we know they learn it? (Assessment)

Is it the responsibility of *students* or *instructors* to monitor and assess learning?

"It sort of makes you stop and think, doesn't it?"
• Knowledge about one’s own cognition
• Thinking about one’s own thinking
• Asking what do I know and what don’t I know
• Regulating how we go about learning

Exploring Metacognition

Write → Pair → Share

(go as far as you can in the allotted time - 6 minutes)

Knowing what you do and do not know.

High-performing students possess better metacognition than low-performing students.

Learners must develop metacognition to take control of their own learning.

Implications for teaching

Metacognition must be integrated into the curriculum by defining learning outcomes and providing opportunities for students to monitor their progress in achieving them.
How can you help your students to be more metacognitive?

Model metacognition

How can you help your students to be more metacognitive?

Provide assignments or discussion opportunities that initiate metacognition

Muddy-point question: What seems murky and unclear and is slowing down your learning progress? What is your plan for clearing up this concern?

Two-minute paper: Before leaving, write down the most important thing you learned today and why it is important.

Faculty commonly overlook the significance of monitoring student learning.

How faculty plan introductory courses was evaluated by a survey of 2311 faculty members from 267 institutions in 12 disciplinary fields.

When asked how they knew that students were learning...

...70% responded that most often they watch students' faces, observe course attendance, and observe student participation in course discussion.

"Learning is not necessarily an outcome of teaching"

Science for All Americans (AAAS, 1989)
Program assessment asks, “Is our department preparing our majors well?”

A. Analyzing whether the department curriculum is meeting the intended learning goals
B. Giving a final exam to students
C. Ongoing two-way communication with students regarding where they are at in a given class

Summative course assessment asks, “What learning has taken place with each student?”

A. Analyzing whether the department curriculum is meeting the intended learning goals
B. Giving a final exam to students
C. Ongoing two-way communication with students regarding where they are at in a given class

Formative course assessment asks, “What learning is taking place with each student?”

A. Analyzing whether the department curriculum is meeting the intended learning goals
B. Giving a final exam to students
C. Ongoing two-way communication with students regarding where they are at in a given class

Assessment is...

Collecting data about what learners understand and can do, evaluating those data, and making decisions based on that evaluation.
Summative assessments are high stakes but if they are not carefully constructed they will produce grades that do not relate to what students learned.

Are your questions valid for measuring the outcomes that you expect students to learn?

Are tests constructed properly? One study found that flawed multiple-choice test items accounted for as much as 41% (median 20%) of the variance in test scores; 10-15% of students who failed the tests arguably should have received passing grades.

Have students received formative feedback on the types of learning that will be summatively assessed?

(see Links on Writing Exam Questions pg. 62)

Formative assessment is all about feedback …

Think- Pair -Share

... to whom?
... for what reason?
... when?

Formative and summative assessment should be related in order to promote learning

Administer formative assessment

Instructor provides feedback to students

Student score: Low

Instructor redresses topic in class

Instructor provides individual assistance to students

Student score: High

Students’ accomplishment of learning objectives summatively assessed on exam

Peer instruction is a research-backed use of clickers to both activate and formatively assess learning

Lecture is interrupted with the projection of a conceptual multiple-choice question related to the topic (ConceptTest)

Students enter a response to the question

Photo by Aurora Pun
How often should we do formative assessment?

p. 61

Formative assessment need not add another layer of instructor work

Make the most of your assignments: In-class-learning assignments can also serve as formative learning assessments.

Administer online assessments using Blackboard Learn.

But – you do need to review student work and adjust instruction, otherwise formative assessment is incomplete and useless.

Return to:
Building a Teachable Unit-Assessment (Part III)

p. 105-106 of workbook
Complete the worksheet with your redesign team. Bloom your assessments when you have finished.

Measuring Learning Gains by...

...pre and post testing with a concept inventory and knowledge survey

Retake the CI/KS Individually, please.

p. 63 of workbook
For more references to knowledge surveys
Part X: Aligning and Evaluating the Teachable Unit

Part X outcome:

You will be able to ...

... align the outcomes, activities, and assessments for your teachable unit
... evaluate the strengths and weaknesses of a teachable unit

Effective course design aligns activities that are formed around these questions:

- What should they learn? (Outcomes)
- How should they learn it? (Instruction)
- How will we know they learned it? (Assessment)

How do we know if our teachable unit components align?

Aligning a Teachable Unit (p. 107-110)
With your redesign-team, align the outcomes, instruction, and assessments for your teachable unit. Use your bloom chart to guide the process.

How do we know if we have built a complete teachable unit?

How can we offer constructive feedback?

Table 5.2 Review Rubric for Teachable Unit

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Level of Completion</th>
</tr>

Reading in Scientific Teaching (p. 47-64, 95-96): Part IV. Course Design and Instructional Change
May 14, 15, & 18, 2015

Facilitators:

Gary A. Smith, PhD
Professor, Earth & Planetary Sciences
Director, Office for Medical Educator Development (OMED)
Co-PI, STEM Gateway
gsmith@unm.edu

Audriana M. Stark, MBA
Doctoral student, Organization, Information & Learning Science
STEM Gateway Teaching Professional Development Assistant
astark@unm.edu

The STEM Gateway program is funded through a U.S. Department of Education Title V grant, 2011-2016, 100% grant funded (total anticipated funding $3.82 million)
Gateway Science and Math Course Redesign Project Description

**Issues to Address**

- Aspiring and declared STEM majors experience high failure rates in gateway science and math courses.
- Research shows that perceived poor quality instruction in science and math courses is the primary factor leading students to depart STEM fields and is a major concern of those who persist.
- Implementation of curricular and pedagogical redesign, primarily focused on various aspects of interactive engagement, has improved student learning in STEM gateway courses, across the disciplines.

The culture of teaching and learning among STEM educators at UNM will be characterized by:
- On-going exploration and adoption of evidence-based and research informed instructional practices.
- Continuous improvement of teaching and learning through reflective practice and meaningful assessment.
- Dialogue about teaching within a social network (communities of practice) that diffuses and supports innovation within and across departments.

**Individual Course Redesign Projects**

One (or two instructors) working to redesign a course that is required and is foundational to at least one STEM major (Contact Gary Smith, gsmith@unm.edu to confirm that your course qualifies). Tenure-stream and Lecturer faculty in natural science, mathematics, and engineering departments are eligible to apply; a graduate student or part-time instructor can partner with a regular faculty member.

Successful applicants will form a faculty learning community. To encourage access to close collaborators, preference will be given to applicants who are either proposing a partner on their project or where two separate proposals are submitted by faculty in the same department.

**Course Redesign Teams**

Each course-reform team consists of:

- 3-4 UNM faculty who frequently teach the targeted gateway course
- 1 UNM Graduate Assistant from the gateway-course department

**Timeline**

STEM Gateway compensation:

The STEM Gateway program is funded through a U.S. Department of Education TITLE V grant, 2011-2016 (total anticipated funding $3.82 million).
“It now appears that all traditionally taught college courses are markedly (though unintentionally) biased against many non-traditional students, and, indeed, against most students who have not attended elite preparatory schools. Thus, when we teach merely in traditional ways we probably discriminate strongly on grounds quite different from those we intend. Easily accessible changes in how we teach have been shown repeatedly to foster dramatic changes in student performance with no change in standards.”

Craig E. Nelson, Professor of Evolutionary Biology, Indiana University

“The biggest and most long-lasting reforms of undergraduate education will come when individual faculty or small groups of instructors adopt the view of themselves as reformers, within their immediate sphere of influence, the classes they teach every day.”

K. Patricia Cross, Professor of Higher Education, University of California, Berkeley
Trustee, Carnegie Foundation for the Advancement of Teaching
Cited in: Tobias, S., 1990, They’re not dumb, they’re different; stalking the second tier

Gateway Science and Math Course Redesign Projects

About Learning

Teaching in STEM

Ideas for Interactive Learning

STEM Gateway
Course Redesign Institute

Part I: Warming Up-
The Instructional Change Process

After completing this session of the institute, course designers will be able to...

... explain the components of a course, including the roles of teachers, learners, subject matter and intended course outcomes

... describe the process of instructional change

Project for Inclusive Undergraduate STEM Success
Effective course design *integrates* activities that are formed around these questions:
Designing Instructional Change to Improve Student Success

Instructional Change Process

**Expand**: How will the changes be expanded across instructors of the course?

**Improve**: What will trigger modifications? When will the modifications be made? Who will make them?

**Evaluate**: How will you know that the redesign is working? Are the stated learning outcomes being achieved? How are students responding?

**Develop**: What will learners do in order to master the objectives? What will be the ingredients of the teachable units? How will learning be assessed in each unit?

**Implement**: How will the changes be implemented – in stages, with a pilot, all at once? Why? What professional development is needed? What additional resources are required?

**Scan**: What pedagogical and/or curricular change options might address the problem?

**Select**: Which change option(s) will most likely succeed? Are the changes aligned to stated learning outcomes? What materials, tools, assignments, and assessments will need to be created or found?

**Motivation**: What is the motive for redesigning your course?

**Expectation**: What should students learn?
Redesign Program instructors will be able to...

1. ... explain the motive for redesigning the course
2. ... define measurable learning outcomes for the course
3. ... identify pedagogical/curricular changes that address the problems that motivated redesign
4. ... develop criteria for selecting, creating, and integrating specific tools, assignments, and assessments to achieve learning outcomes
5. ... create a course curriculum of teachable units that integrate in-class and out-of-class learning
6. ... construct a plan with a timeline, milestones, and goals for partial to full implementation of redesign, which identifies additional STEM Gateway consultation and other resource needs
7. ... develop an assessment plan that tracks student achievement of outcomes and affect, and instructor affect towards redesign efforts
8. ... use data to inform modification of redesign plans including a process for determining when modifications should be made and who will make modifications
9. ... create a plan for sustaining the redesign and expanding to include all instructors of the course

*Outcomes 1-6 are targeted at the redesign institute, including creation of a complete teachable unit*
Part II: What Motivates You and Your Learners

After completing this session of the institute, course designers will be able to...

... explain why STEM-course redesign is important to student success

... articulate a vision for their redesign project

... use expectancy-value motivation as a foundation for engaging learners
Motivation for Course Redesign

STEM disciplines suffer the greatest undergraduate student attrition.

![Graph showing student attrition by discipline](image)

**STEM courses are prominent entries on the “Killer course” list**

![Bar chart showing course completion rates](image)

*Courses enrolling more than 100 students and where >20% do not complete with a C or higher grade*

Data from UNM Office of Institutional Analytics
The STEM Gateway Course Redesign Program

Vision

The culture of teaching and learning among STEM educators at UNM will be characterized by:

- On-going exploration and adoption of evidence-based and research-informed instructional practices.
- Continuous improvement of teaching and learning through reflective practice and meaningful assessment
- Dialogue about teaching within a social network (communities of practice) that diffuses and supports innovation within and across departments

Fulfilling this vision will result in improved student achievement of learning outcomes, recruitment to STEM fields, and retention in STEM to degree attainment, especially among Hispanic and low-income students.

(Inspired by WIDER PERSIST, Boise State University)

Mission

The STEM Gateway Course Redesign Program informs and guides STEM educators to effectively implement evidence-based and research-informed pedagogies through individual and community-based professional development in order to improve the academic success of undergraduate STEM students, especially of Hispanic and/or low-income backgrounds.
What is Your Vision?

A vision statement defines a mental picture of the optimal future state of your redesign project… a “North Star” that all aspects of your redesign effort are navigating toward.
What motivates students to learn?

*Think both generally and specifically in your course. Consider how these motivating factors do or can influence your instructional choices.*
Achievement motivation relies on **value** and **expectancy**

A goal that I value ...

... and a belief that I can make it!

**What We Value**

Underlies What We Do

And How We Do It
Part III: What Should Students Learn? Defining Course Level Outcomes

After completing this session of the institute, course designers will be able to...

... define SMART student learning outcomes for their course

... analyze the cognitive processes and knowledge acquisition specified by a SMART outcome
Developing Learning Objectives: The Foundation for Effective Course Design
(Source: UNM Office for Medical Educator Development)

What is a learning objective?
A learning objective is an outcome statement that captures specifically what knowledge and skills learners should be able to exhibit following instruction. A common misapplication of objectives is for the teacher/presenter to state what he/she is going to do (e.g., “My plan this morning is to talk about...”), rather than what the student is expected to be able to do (e.g., “After this session, you should be able to...”).

Why have learning objectives?
Creating clear learning objectives during the planning process of a course/unit/week/individual session serves the following purposes:

- Helps instructors and course leaders to integrate across a day/week/unit of learning.
- Connects course content and assessment to the learning process.
- Gives learners a clear picture of what to expect and what’s expected.
- Forms the basis for evaluating teacher, learner, and curriculum effectiveness.

What are the key components of a learning objective?
Learning objectives should be “SMART”:

Specific
Measurable
Attainable for target audience within scheduled time and specified conditions
Relevant and results-oriented
Targeted to the learner and to the desired level of learning

How do I create a useful learning objective?
To create specific, measurable, and results-oriented objectives:

- It’s helpful to finish the sentence, “After this unit/week/individual session, you should be able to...”
- Start with an observable-action word that captures what the learner should be able to do
- Avoid ill-defined terms that are open to variable interpretation (e.g., understand, learn, grasp)
- When necessary, specify criteria concerning expected standard of performance (e.g., “Describe a mechanism in support of your hypothesis from the organ system down to the level of cells and molecules.”).

To create attainable learning objectives:

- Consider the beginning level of understanding/skill of your learners and craft your objective to move them to the next level.
- Consider and specify the conditions under which the performance will take place (e.g., “On a written exam, describe...” or “With a standardized or actual patient, demonstrate...”)
- Limit the number of objectives to the major learning points you would like students to walk away with.

To create objectives targeted to the audience and desired level of learning/thinking:

- Ask yourself whether you want learners to be able to remember, comprehend, apply, analyze, evaluate, or create. These cognitive processes represent progressively higher levels of thinking and determine the learning activities and assessments required for mastery.
- Ask yourself about the type of knowledge that will be mastered by the outcome — factual, conceptual, procedural, and metacognitive. These knowledge types determine the learning activities that will be necessary for developing knowledge.
- Match your action verb to the desired cognitive level.
Let’s evaluate: *What do you think of the quality of these outcomes?*

I want to encourage writing fluency and confidence.

In this course students will understand that poverty is a complex issue.

Students will be able to identify rocks and minerals.

Students will solve linear equations in one variable.

Students will be able to apply their knowledge of statistics to analyze reports and claims in the popular press.

Outcomes should exist at multiple, connected levels

1. Degree-level outcomes
2. Course-level outcomes
3. Teachable Unit-level outcomes
### Bloom’s Taxonomy of the Cognitive Domain

<table>
<thead>
<tr>
<th>Cognitive process</th>
<th>What the learner does:</th>
</tr>
</thead>
<tbody>
<tr>
<td>6. Create</td>
<td>Brings together parts to form a new whole or solve a problem that requires new creative thinking.</td>
</tr>
<tr>
<td>5. Evaluate</td>
<td>Judges the value of something by application of criteria, processes, or standards.</td>
</tr>
<tr>
<td>4. Analyze</td>
<td>Identifies how parts relate to one another or to a larger structure or purpose; considers available evidence to reach a conclusion, inference or generalization. Use methods, concepts, principles, theories in new situations; solve realistic problems that require the identification of issues and use of appropriate generalizations and skills.</td>
</tr>
<tr>
<td>3. Apply</td>
<td>Constructs meaning by explaining, classifying, comparing, summarizing.</td>
</tr>
<tr>
<td>2. Understand</td>
<td>Recalls or recognizes information: facts, definitions, generalizations.</td>
</tr>
<tr>
<td>1. Remember</td>
<td></td>
</tr>
</tbody>
</table>

#### Knowledge type: Knowledge gained:

<table>
<thead>
<tr>
<th>Knowledge type</th>
<th>Knowledge gained:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Factual</td>
<td><em>Basic elements</em> (e.g., terms, people, formulas) that learners must know to be acquainted with a discipline or solve problems in the discipline.</td>
</tr>
<tr>
<td>2. Conceptual</td>
<td>The <em>interrelationships among the basic elements</em> within a larger structure that enables the elements to function together (e.g., classifications, principles, theories, models, structures).</td>
</tr>
<tr>
<td>3. Procedural</td>
<td><em>How to do something</em> — methods of inquiry, algorithms, techniques — along with criteria for when to use appropriate procedures.</td>
</tr>
<tr>
<td>4. Metacognitive</td>
<td>Knowledge of learning and awareness of one’s own cognition — “<em>knowing what you do and do not know</em>”</td>
</tr>
</tbody>
</table>

<table>

# Guide to Using Bloom’s Taxonomy of Learning in the Cognitive Domain

*Adapted from L. W. Anderson and D. R. Krathwohl (eds). *A Taxonomy for Learning, Teaching and Assessing, 2001* (revised from Bloom’s, 1956, Taxonomy)

<table>
<thead>
<tr>
<th>Cognitive Process</th>
<th>What the Learner Does</th>
<th>Action Verbs for Writing Outcomes</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Remember</strong></td>
<td>Recalls or recognizes information: facts, definitions, generalizations</td>
<td>List, describe (from memory), name, label, repeat, recall, identify, state, select, match, know, locate, recognize, observe, choose, who, what, where, when, cite, define, indicate, memorize, outline, record, relate, reproduce, sort</td>
<td>Students will be able to list five leadership styles and provide a thorough definition of each. Students will be able to match important events in US history to the year in which they occurred. Students will be able to identify rocks and minerals.</td>
</tr>
<tr>
<td><strong>Understand</strong></td>
<td>Constructs meaning by interpretation, classification, comparing, explaining, summarizing</td>
<td>Explain, restate, review, relate, clarify, illustrate, demonstrate, translate, diagram, sketch, outline, summarize, organize, paraphrase, transform, compare similarities and differences, give examples, arrange, associate, convert, discuss, estimate, extend, generalize, report, solve/calculate (similar to a solved example)</td>
<td>Students will be able to explain the causes of World War I. Students will be able to summarize opposing points of view about legalizing drug use. Students will be able to sketch a eukaryotic cell and label its parts.</td>
</tr>
<tr>
<td><strong>Apply</strong></td>
<td>Uses methods, concepts, principles, and theories in new situations; solve realistic problems that require the identification of issues and use of appropriate generalizations and skills.</td>
<td>Apply, practice, employ, use, illustrate, collect, change, graph, compute, construct, develop, interpret, investigate, manipulate, modify, operate, predict, prepare, produce, schedule, sketch, solve/calculate (for a new situation)</td>
<td>Students will be able to calculate the forces exerted on beams in a building. Students will be able to develop an inventory-control plan for a manufacturing firm. Students will demonstrate the ability to digitally edit a photograph using appropriate software tools.</td>
</tr>
<tr>
<td><strong>Analyze</strong></td>
<td>Identifies how parts relate to one another or to a larger structure or purpose; considers available evidence to reach a conclusion, inference or generalization</td>
<td>Analyze, dissect, detect, test, deconstruct, discriminate, distinguish, examine, focus, find coherence, survey, investigate, separate, structure, determine evidence and conclusions, appraise, break down, deduce, criticize, debate, experiment, infer, inspect, inventory, question, relate, select, map, research, interpret</td>
<td>Students will be able to determine the point of view or bias of an author. Students will be able to test a claim or hypothesis using data tables and graphs. Students will be able to deconstruct a word problem into mathematical expressions.</td>
</tr>
<tr>
<td><strong>Evaluate</strong></td>
<td>Judges the value of something by setting up criteria, processes, or standards and then determining how closely the idea or object meets the standards.</td>
<td>Coordinate, judge, select/choose, decide, debate, evaluate, justify, recommend, verify, monitor, the best way, what worked, what could have been different, what is your opinion, appraise, assess, conclude, criticize, discriminate, estimate, grade, prioritize/rank, rate, revise, score, support, value</td>
<td>Students will be able to assess the leadership strengths and weaknesses of recent US presidents. Students will be able to use a rubric to rate design models and recommend changes. Students will be able to choose potential home sites based on their knowledge of geologic hazards.</td>
</tr>
<tr>
<td><strong>Create</strong></td>
<td>Brings together parts to form a new whole or solve a problem that requires new creative thinking (at least new to the learner).</td>
<td>Create, hypothesize, design, construct, invent, imagine, discover, develop, induce, bring together, compose, pretend, predict, organize, plan, modify, improve, suppose, produce, set up, propose, formulate, solve (more than one answer), arrange, assemble, combine, devise, generate, manage, perform, prepare, dramatize, paint, compose, rearrange, reconstruct, relate, reorganize, revise, argue for, speculate</td>
<td>Students will create a new product. Students will generate testable hypotheses from existing observations. Students will compose an original score.</td>
</tr>
</tbody>

Part IV: What Should Students Learn? Defining Teachable Unit Level Outcomes

After completing this session of the institute, course designers will be able to...

... define a teachable unit as an explicit, outcomes-driven module for a course

... connect teachable-unit-level outcomes to course-level outcomes as a process of scaffolded learning
Throughout the institute, you will build a teachable unit.

*Instructional materials that enclose the activities, assignments, and assessments within a time-defined part of the course that are designed to achieve learner mastery of an essential concept and/or a course outcome.*

May be a plan for one class period, one week, or some other part of the whole course.

Is constructed so that other instructors could execute the unit.

Part V: How Will Students Learn? Where Learning Begins

After completing this session of the institute, course designers will be able to...

... describe the fundamental learning centers in the brain

... begin an analysis of how students’ prior knowledge affects learning in the targeted course
What is your definition of “learning?”

“It dawned on me about two weeks into the first year that it was not teaching that was taking place in the classroom, but learning.”

What is your definition of “teaching?”
The most effective learning triggers all learning centers in the brain

(after Zull, 2002, The Art of Changing the Brain)

Integration: “making sense”, new understanding, manipulating working memory

Sensory input: sight and sound; concrete experience

Integration: long-term memory; connection to what is already known; forming new neural networks through repetition, elaboration, and sleep

Actions: writing, discussing, experimenting, testing

Image modified from Brain-Behavior Optimization Center:

“If I had to reduce all of educational psychology to just one principle, I would say this: The most important single factor influencing learning is what the learner already knows. Ascertain this and teach him accordingly”

David Ausubel

Knowledge is associative—it is linked to prior mental models and cognitive structures

If a learner’s initial misunderstanding is not engaged he or she may fail to grasp new concepts, correct concepts, or both.

Teaching is not about pouring knowledge into the learners’ empty brains

*How People Learn*, National Research Council, 2000

Image at: http://medicine.ukzn.ac.za/Libraries/Division_of_Clinical_Medicine/fact_pouring.sflb.ashx

Knowledge is associative—it is linked to prior mental models and cognitive structures

... and can include prior misconceptions.

If a learner’s initial misunderstanding is not engaged he or she may fail to grasp new concepts, correct concepts, or both.

“It ain’t what you don’t know that gets you into trouble. It’s what you know for sure that just ain’t so.”

- Mark Twain

*How People Learn*, National Research Council, 2000
Part VI: How Will Students Learn? The Science Behind Scientific Teaching

After completing this session of the institute, course designers will be able to

... apply cognitive psychology principles to determine the likely efficacy of instructional approaches
... recognize learning along the interactive-passive continuum
... explain to a colleague why active learning generates greater learning achievements than traditional lecture
**Active learning is:**

<table>
<thead>
<tr>
<th>Why I do or would use active learning</th>
<th>Why I don’t or wouldn’t use active learning</th>
</tr>
</thead>
</table>

Failure rates under traditional lecturing (avg. 33.8%) increase by 55% over the rates observed under active learning (21.8%).

“If the experiments analyzed here had been conducted as randomized controlled trials of medical interventions, they may have been stopped for benefit—meaning that enrolling patients in the control condition might be discontinued because the treatment being tested was clearly more beneficial.”

How does instruction affect how much students learn?

How the classes were taught:

**Expert teacher, traditional lecture**
- Lecture accompanied by PowerPoint slides to present content and example problems
- Demonstrations
- “Clicker” questions (average 1.5 per class, range 0 to 5) were used for summative evaluation (which was characterized by individual testing without discussion or follow-up other than a summary of the correct answers).
- Students were instructed to read the relevant chapter in the textbook before class

**Novice teacher, interactive engagement**
- Pre-class reading assignments
- Pre-class reading quizzes
- In-class “clicker” questions with student-student discussion (peer instruction): typically 3 per class, with 3-8 minutes used for discussion, voting, and instructor feedback on each question
- Small-group active learning tasks; questions that required a written response
- No formal lecturing; however, guidance and explanations were provided by the instructor throughout the class. The instructor responded to student-generated questions, to results from the clicker responses, and to what the instructor heard by listening in on the student-students discussions.

How was the difference in learning related to the difference in teaching?

Deslauriers et al., 2011, Science
There are three, inter-related memory-forming processes:

- **Encoding**: Incoming stimulus converted into a “memory trace.”
- **Re-consolidation**: Reorganization and stabilization of memory traces; connections to past experiences and stored knowledge.
- **Retrieval**: Drawing on memories in new situations.
Active learning includes favorable encoding that is consolidated and retrievable

1. Selecting:

2. Elaboration:

3. Generation effect:

Consolidation (and re-consolidation) is affected by the timing of the encoding process

4. Spacing:

Retrieval is part of learning as well as testing

5. Testing effect:
## Differentiated Learning Activities – The ICAP Framework

Part VII: Where Does Learning Take Place?

After completing this session of the institute, course designers will be able to...

... sketch the learning-activity sequence as a framework for building a teachable unit.
To maximize our time, what could we provide as:

<table>
<thead>
<tr>
<th>Preparation before class</th>
<th>Follow-up after class</th>
</tr>
</thead>
</table>

The *learning activity sequence* structures what is learned both in and out of class.

**Learning Activity Sequence**

- **Learning Before Class**
  - First contact with content before *and* outside of class

- **Learning In Class**
  - Interactive learning *during* and *inside* class

- **Learning After Class**
  - Monitoring and elaborating on learning *after* and *outside* of class

**Assessing learning**
Some key references regarding active learning

Haak, D. C., J. HilleRisLambers, E. Pitre, and S. Freeman, Increased structure and active learning reduce the achievement gap in introductory biology. *Science*, 332 (2011), 1213–16

Van der Vleuten, C P M, and E W Driessen, What would happen to education if we take education evidence seriously?’, *Perspectives on Medical Education*, 3 (2014), 222–32

Expert explanation after novice construction of knowledge leads to better learning transfer

Learning retention and transfer is improved by spaced rather than massed study

Students were taught a microsurgical procedure in either:

- 1, 8-hour session (massed)
- 4, 2-hour weekly sessions (spaced)

Moulton et al., 2006, Teaching surgical skills: What kind of practice makes perfect? Annals of Surgery, 244(3): 400–409

Testing, and learner self-explanation are critical to effective, long-term learning

Students ...

a) Received lecture instruction on 4 topics,
b) received one of 4 of four weekly learning sessions following each topic, and
c) were assessed with a knowledge-application test on the four topics, 6 months later.

STEM Gateway
Course Redesign Institute

Day 2
May 15th, 2015
Each of the paragraphs below represents a different perspective on 'good teaching,' as indicated by the large bars on your profile sheet.

Together, they will help you understand and interpret your profile. Keep in mind that these five are not mutually exclusive perspectives. In our research involving thousands of teachers, the vast majority hold one or (sometimes) two dominant perspectives. Many hold an additional 'back-up' perspective that is high, although not dominant. This combination of dominant and back-up perspectives allows teachers to accommodate changes in context, content, and learners. Common sense requires that no one can operate from all five simultaneously, since they represent contrasting and sometimes competing views of teaching.

On your profile sheet you also have sub-scores for Beliefs (B), Intention (I), and Actions (A) within each perspective. These sub-scores scores will further help to identify your philosophy of teaching by highlighting whether your views within a perspective are grounded (differentially or equally) in what you believe, what you intend to accomplish, or what educational actions you undertake in your teaching settings.

<table>
<thead>
<tr>
<th>Transmission</th>
<th>Effective teaching requires a substantial commitment to the content or subject matter.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Good teaching means having mastery of the subject matter or content.</td>
</tr>
<tr>
<td></td>
<td>Teachers' primary responsibilities are to represent the content accurately and efficiently. Learner's responsibilities are to learn that content in its authorized or legitimate forms. Good teachers take learners systematically through tasks leading to content mastery: providing clear objectives, adjusting the pace of lecturing, making efficient use of class time, clarifying misunderstandings, answering questions, providing timely feedback, correcting errors, providing reviews, summarizing what has been presented, directing students to appropriate resources, setting high standards for achievement and developing objective means of assessing learning. Good teachers are enthusiastic about their content and convey that enthusiasm to their students. For many learners, good transmission teachers are memorable presenters of their content.</td>
</tr>
</tbody>
</table>
| Apprenticeship | Effective teaching is a process of socializing students into new behavioral norms and ways of working.  
Good teachers are highly skilled practitioners of what they teach. Whether in classrooms or at work sites, they are recognized for their expertise. Teachers must reveal the inner workings of skilled performance and must translate it into accessible language and an ordered set of tasks which usually proceed from simple to complex, allowing for different points of entry depending upon the learner's capability. Good teachers know what their learners can do on their own and where they need guidance and direction; they engage learners within their 'zone of development'. As learners mature and become more competent, the teacher’s role changes; they offer less direction and give more responsibility as students progress from dependent learners to independent workers. |
| Developmental | Effective teaching must be planned and conducted "from the learner's point of view."  
Good teachers must understand how their learners think and reason about the content. The primary goal is to help learners develop increasingly complex and sophisticated cognitive structures for comprehending the content. The key to changing those structures lies in a combination of two skills: (1) effective questioning that challenges learners to move from relatively simple to more complex forms of thinking, and (2) 'bridging knowledge' which provides examples that are meaningful to the learner. Questions, problems, cases, and examples form these bridges that teachers use to transport learners from simpler ways of thinking and reasoning to new, more complex and sophisticated forms of reasoning. Good teachers adapt their knowledge to learners’ levels of understanding and ways of thinking. |
| Nurturing | Effective teaching assumes that long-term, hard, persistent effort to achieve comes from the heart, not the head.  
People become motivated and productive learners when they are working on issues or problems without fear of failure. Learners are nurtured in knowing that (a) they can succeed at learning if they give it a good try; (b) their achievement is a product of their own effort and ability, rather than the benevolence of a teacher; and (c) their learning efforts will be supported by both teacher and peers. Good teachers care about their students and understand that some have histories of failure resulting in lowered self-confidence. However they make no excuses for learners. Rather, they encourage their efforts while challenging students to do their very best by promoting a climate of caring and trust, helping people set challenging but achievable goals, and supporting effort as well as achievement. Good teachers provide encouragement and support, along with clear expectations and reasonable goals for all learners but do not sacrifice self-efficacy or self-esteem for achievement. Their assessments of learning consider individual growth as well as absolute achievement. |
| Social Reform | Effective teaching seeks to change society in substantive ways.  
From the Social Reform point of view, the object of teaching is the collective rather than the individual. Good teachers awaken students to values and ideologies that are embedded in texts and common practices within their disciplines. Good teachers challenge the status quo and encourage students to consider how learners are positioned and constructed in particular discourses and practices. To do so, they analyze and deconstruct common practices for ways in which such practices perpetuate conditions that are unacceptable. Class discussion is focused less on how knowledge has been created, and more by whom and for what purposes. Texts are interrogated for what is said and what is not said; what is included and what is excluded; who is represented and who is omitted from the dominant discourse. Students are encouraged to take critical stances to give them power to take social action to improve their own lives and the lives of others. Critical deconstruction, though central to this view, is not an end in itself. |
Part VIII: Building A Teachable Unit-Selecting Pedagogy and Content for Student Success

After completing this session of the institute, course designers will be able to ...

... draft peer instruction Q & A prompts
... create teachable units for their redesigned course using the learning activity sequence
... analyze a teachable unit to assure alignment of learning activities with learning outcomes
### Before Learning

---

**Instructions:**

1. Place a ✓ in the box that represents your goal for each learning-sequence stage in your current teaching sessions.
2. Place an × in the box that is most representative of each learning-sequence stage in your current teaching sessions.

**Potential ICAP levels:**
- Interactive / Constructive / Active / Passive

**Memory builders:**
- Selecting / Elaboration / Generation / Testing effect

---

**Increasing learning potential**
From Questions to Concepts - Debrief

How is the learning activity sequence being applied?

How are students’ misconceptions and prior knowledge being addressed?

Why is it important to make learning “visible”?

Where does pre-class work plot on the ICAP framework?

Where does in-class work plot on the ICAP framework?

What was the role of peer instruction for both promoting and assessing learning?
Peer instruction is a research-based use of clickers to both promote and formatively assess learning.

Lecture is interrupted with the projection of a conceptual multiple-choice question related to the topic (ConcepTest). Students respond with their clicker.

Example of peer instruction:
A crate is moving to the right on a conveyor belt without slipping. The conveyor belt maintains a constant speed. The force of friction on the crate is:

A. To the right
B. Zero
C. To the left
D. Insufficient information to answer

Students discuss their competing answers with one another.

Students enter a second response to the question.

After discussing with peers:

Eric Mazur interactive physics lecture at Harvard
https://www.youtube.com/watch?v=wont2v_LZ1E
Building a teachable unit focuses on questions about what learners do at the end of the class session. What should learners know/be able to do, at the end of the class session? What should learners do in class to master the objective? How will this activity benefit from peer and instructor interaction? How should learners prepare themselves before class? What reading, video, animation, simulation, etc. introduces the content concepts most effectively? How should learners practice the expected thinking and monitor and elaborate on learning after class?

The learning activity sequence structures what is learned both in and out of class.

Learning Before Class → Learning In Class → Learning After Class

Learning Activity Sequence

First contact with content before and outside of class. Interactive learning during and inside class. Monitoring and elaborating on learning after and outside of class.

Assessing learning

Photo by Aurora Pun

Photo by UNM
Within the learning activity sequence...

... students engage with learning the content during class time with peer and instructor influence, ...

... which means that students must be prepared by making first contact with (and thinking about) content prior to class.

You may have of heard these concepts as “flipped learning”

In Class

Out of Class

“Traditional” course structure
Part IX: Assessing What Students Are Learning

After completing this session of the institute, course designers will be able to...

... develop formative and summative assessments of learning outcomes
... analyze assessments to assure alignment with learning outcomes and learning activities
Is it the responsibility of students or instructors to monitor and assess learning?

"It sort of makes you stop and think, doesn't it."

Cartoon by Sam Gross

- Knowledge about one's own cognition
- Thinking about one's own thinking
- What do I know and what don't I know?
- Regulating how we go about learning

N. Kremenek
Knowing What You Do and Do Not Know

“I can’t believe that I got a D on this test; I really understand all of this stuff.” How many times have you heard this statement from a student? Can it really be possible that learners don’t know that they do not know?

Students who obtain high grades tend to possess strong metacognition. That means that they are able to determine what they know and what they don’t know, and adjust their study and questioning habits to focus on perceived weaknesses in understanding. Low-performing students, on the other hand, tend to over-estimate their abilities and knowledge and score much worse than they expected on learning assessments. Most of these latter students, arguably, are capable of succeeding if they only knew that their perceptions of learning were incorrect.

The graph below comes from a classic study by Kruger and Dunning\(^1\). A group of students at Cornell University completed a test of logical reasoning ability. After the test, but before the results were released, the students were each asked to estimate their grade on the test. On average, no quartile group felt that they had missed more than half the points. Students who scored in the top quartile slightly underestimated their test score but in the successively lower quartile groups, the negative disparity between test score and perceived score increases.

Answer the following questions. When you have finished, partner with a person beside you and discuss your answers.

1. What is the take away point of this study?

2. Name 2 ways you can improve students’ metacognition in your course.

---

\(^1\) J. Kruger and D. Dunning, 1999, *J. of Personality and Social Psychology*, 77(6), 1121-1134
How can you help your students to be more metacognitive?

Model metacognition

Provide assignments or discussion opportunities that initiate metacognition

**Muddy-point question:** What seems murky and unclear and is slowing down your learning progress? What is your plan for clearing up this concern?

**Two-minute paper:** Before leaving, write down the most important thing you learned today and why it is important.
Assessing Student Learning

Assessment is...

Collecting data about what learners understand and can do, evaluating those data, and making decisions based on that evaluation.

Program assessment asks, “Is our department preparing our majors well?”

A. Analyzing whether the department curriculum is meeting the intended learning goals
B. Giving a final exam to students
C. Ongoing two-way communication with students regarding where they are at in a given class

Summative course assessment asks, “What learning has taken place with each student?”

A. Analyzing whether the department curriculum is meeting the intended learning goals
B. Giving a final exam to students
C. Ongoing two-way communication with students regarding where they are at in a given class

Formative course assessment asks, “What learning is taking place with each student?”

A. Analyzing whether the department curriculum is meeting the intended learning goals
B. Giving a final exam to students
C. Ongoing two-way communication with students regarding where they are at in a given class
Summative assessments are high stakes but if they are not carefully constructed they will produce grades that do not relate to what students learned.

Are your questions valid for measuring the outcomes that you expect students to learn?

Are tests constructed properly? One study found that flawed multiple-choice test items accounted for as much as 41% (median 20%) of the variance in test scores; 10-15% of students who failed the tests arguably should have received passing grades.

Have students received formative feedback on the types of learning that will be summatively assessed?

Formative assessment is all about feedback …

... to whom? ... for what reason? ... when?

Always designed with outcomes in mind

Formative and summative assessment should be related in order to promote learning

How often should we do formative assessment?

Formative assessment need not add another layer of instructor work

Make the most of your assignments: In-class-learning assignments can also serve as formative learning assessments.

Administrer online assessments using Blackboard Learn.

But – you do need to review student work and adjust instruction, otherwise formative assessment is incomplete and useless.

Part X: Aligning and Evaluating the Teachable Unit

After completing this session of the institute, course designers will be able to...

... align the outcomes, activities, and assessments that your built for your TU

... evaluate the strengths and weaknesses of a teachable unit
<table>
<thead>
<tr>
<th>Criteria</th>
<th>Levels of Completion</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Comprehensive</td>
</tr>
<tr>
<td>Learning Goals and Outcomes</td>
<td>Overall: Students will experience the nature of science in this unit and know what is expected of them.</td>
</tr>
<tr>
<td>Goals—What students will know, understand, or be able to do</td>
<td>It is clear what students will know, understand, and be able to do after they have completed this unit. The goals are challenging, interesting, and appropriate for the intended students. It is clear what knowledge (concepts, topics, theories, facts, and terminology) students are expected to learn and what behaviors and performances typify understanding.</td>
</tr>
<tr>
<td>Outcomes—What performances or behaviors will indicate accomplishment of the goals</td>
<td>Overall: Students will be actively engaged in learning. The activities follow a logical progression within a unit and will effectively engage students. It is clear how the activities elicit students’ prior knowledge and address common misconceptions.</td>
</tr>
<tr>
<td>Active Learning</td>
<td>Overall: Students will be actively engaged in learning. The activities follow a logical progression within a unit and will effectively engage students. It is clear how the activities elicit students’ prior knowledge and address common misconceptions.</td>
</tr>
<tr>
<td>How students will engage actively in learning</td>
<td>Overall: Students will know what is expected of them and will receive regular feedback about learning. The assessments provide instructors and students with useful feedback about student learning throughout the unit and at the end of the unit. Assessments are designed to drive student learning toward the goals. Criteria for evaluation and grading are clear.</td>
</tr>
<tr>
<td>Diversity</td>
<td>Overall: All students will be included in learning. The unit offers some opportunity for students to construct their own learning, but could include more diverse or effective teaching methods. The unit could use more examples that reflect student diversity in cultural background, gender, learning skills, or physical abilities. The unit includes diverse teaching methods, but otherwise does not address student diversity.</td>
</tr>
<tr>
<td>---</td>

Creating a culture of sharing, communicating, and working together to improve STEM student success

Dialogue about teaching within a social network (communities of practice) that diffuses and supports innovation within and across departments.
STEM Gateway
Course Redesign Institute

Day 3
May 18th, 2015

Project for Inclusive Undergraduate STEM Success
Learning takes place in the minds of students and nowhere else, and the effectiveness of teachers lies in what they can induce students to do. The beginning of the design of any educational procedure is dreaming up experiences for students: things that we want students to do because these are the activities that will help them to learn this kind of information and skill. And then we can back off and ask what we have to do to get students to carry out these activities.

The most influential cause of the failure of science education is that science has been so frequently presented just as so much ready-made knowledge, so much subject-matter of fact and law, rather than as the effective method of inquiry into any subject-matter.

- John Dewey

Research has taught us a great deal about effective teaching and learning in recent years, and scientists should be no more willing to fly blind in their teaching than they are in scientific research

Bruce Alberts, President, National Academy of Sciences

...most introductory courses rely on “transmission-of-information” lectures and “cookbook” laboratory exercises — techniques that are not highly effective in fostering conceptual understanding or scientific reasoning. There is mounting evidence that supplementing or replacing lectures with active learning strategies and engaging students in discovery and scientific process improves learning and knowledge retention.

If college students are encouraged to learn only the facts and details and aren’t required to comprehend the information, they’re left with superficial, nonenduring knowledge. Understanding, not facts, is what education is all about. It’s understanding that’s left after you’ve forgotten all the details.

Thomas Lord
President Society of College Science Teachers

Who will do science? That depends on who is included in the talent pool. The old rules do not work in the new reality. It’s time for a different game plan that brings new players in off the bench.

Shirley M. Malcom
Head, AAAS Directorate for Education and Human Resources Programs
Part XI: Planning and Rolling Out the Redesign

After completing this session of the institute, course designers will be able to...

... create a work plan for redesigning the course
... create an implementation plan for new course components
| Real Course - Where we are now | Ideal Course – Our vision for the redesigned course | Pathway |
Planning a SMART Redesign Project

“If you don't know where you're going, chances are you will end up somewhere else.” -Yogi Berra

When planning for a successful redesign, start with the end in mind. The following prompts are provided to help you construct a plan that includes a goal, milestones, and a timeline for partial to full implementation of the redesign. Your plan should also include additional STEM Gateway consultation and other resource needs. You can use the timeline on the next page to help you plot the activities sequentially. Anticipate that timelines may shift and goals may be revised as you make progress. As you respond to the prompts

1. **Specific Goals.** What goal are you trying to accomplish? What are you trying to achieve by redesigning the course? What are your goals for summer ’15, fall ’15, spring ’16 and summer ’16?

2. **Milestones.** List all milestones or sub-goals that will need to occur in order to reach your goal. **Measurable.** How will you measure whether or not the goal has been reached (list at least two indicators)?

3. **Action items.** What are the specific action items that need to be accomplished to meet each milestone/ sub-goal?

4. **Resources.** Do you have the necessary knowledge, skills, abilities, and resources to accomplish the goal? What resources do you have? What resources do you need? What resources can STEM G provide? Who will be responsible for accomplishing each activity listed?

5. **Time-bound.** What is the established completion date and does that completion date create a practical sense of urgency? Write tentative due dates for each activity, milestone, and goal.
Remember to consider the following while planning a successful redesign:

**Develop:** What materials, tools, assignments, and learning assessments will need to be created or found?

**Implement:** How will the changes be implemented – in stages, with a pilot, all at once? Why? What professional development is needed? What additional resources are required?

**Evaluate:** How will you know that the redesign is working? Are the stated learning outcomes being achieved?

**Improve:** What will trigger modifications? When will the modifications be made? Who will make them?

**Expand:** How will the changes be expanded across instructors of the course? How will new instructors be brought up to speed?

Lessons in Learning from Gateway STEM Courses
An Example from Physics

Many studies have addressed the effect of instruction on the depth of student learning. The largest data set addresses conceptual learning in first-semester physics based on pre- and post-term testing of more than 6500 students in 62 classes\(^1\). The test consisted of nationally validated questions that assess conceptual, qualitative understanding of the fundamental laws of motion that are the focus of the first-semester course. Although instructional approaches varied, the learning environments could be generalized as either traditional lecture plus lab, or class sessions with a significant component of active learning. In the latter classes, students engaged in small-group discussion or problem solving that forced retrieval and use of knowledge rather than passive absorption through listening. In some cases the active learning focused on use of peer-instruction with clickers, whereas other instructors had pairs of students work with in-class worksheets (lecture tutorials) or devoted significant class time for students to test predictions with simple experiments.

The different learning gains based on instruction are dramatic, as indicated in the graph at top right. The dashed lines show normalized gain, which is the amount of gain possible between pre- and post-tests. For example, if a student scored 20% on the pretest and 40% on the post-test, they gained 20 percentage points out of a possible 80, for a normalized gain of 25%. For most active-learning classrooms, the normalized learning gains were two to three times greater than in the traditional classrooms.

One of the more interesting approaches to interactively engage students with learning physics blends traditional lecture and laboratory time in classrooms that are specifically designed to foster teamwork and cooperative learning. The Student-Centered Activities for Large Enrollment Undergraduate Programs (SCALE-UP) originated at North Carolina State University and has now spread to many campuses and moved to disciplines other than physics.

Not only do SCALE-UP students demonstrate greater conceptual understanding of physics but they also achieve better grades. As shown in the graph below\(^2\), North Carolina State students in many demographic groups achieved higher grades in the SCALE-UP classes. In addition, well-known achievement gaps between white males and other students are substantially reduced.

---

\(^2\) Beichner, Saul, et al., 2007, *Rev. of Physics Ed. Res.* 1
STEM faculty commonly complain that students learn course subjects and problem-solving strategies by rote rather than understanding underlying concepts, principles, and theories and integrating this deeper understanding for transfer to other courses. To a large extent, this disparity between teacher expectation and student behavior and performance is rooted in how reasoning develops from childhood to adulthood. Teacher experts appreciate, through practice and experience, that conceptual understanding of abstract principles provides a framework for deductive reasoning that predicts or permits derivation of new ideas and facts. So, they tend to expect this reasoning in their students. However, novices—both to a discipline but to complex reasoning—are much more likely to build understanding inductively from concrete, sensed experiences. Ultimately, if we want students to truly understand scientific disciplines and to think scientifically, we need to help them develop more expert reasoning abilities.

This was the objective of geology faculty at the University of Akron. They examined the role of instruction in transforming students from concrete operational thinkers (who do not simultaneously manage multiple concepts, use induction exclusively, rely on information within a question as the only source of evidence for their brief and incomplete answers) to abstract operational thinkers. Concrete operational students typically seek a single, correct solution and have difficulty constructing responses for open-ended questions—a tendency to answer questions by “finding” answers in text or sample solutions rather than reasoning and “constructing” answers. Concrete operational thinkers are not only novices to the discipline but are novice thinkers. Abstract operational thinkers can make predictions in hypothetical situations that require going beyond their experiences to build conclusions on logic and inferences or to design solutions to new problems. With deeper working memory, these thinkers keep the questions, key concepts, and their inter-relationships in mind together while constructing answers that show recognition of how variables influence each other and show evidence of deduction to explain specific concepts in relation to a general rule that may not be discussed in the question.

The Akron professors adopted a goal to foster the development of higher order thinking skills of the abstract operational thinker so as to encourage student conceptual understanding of the geosciences. They measured reasoning ability by administering a validated assessment of competence in proportional reasoning, controlling variables, combinational reasoning, probabilistic reasoning, and correlational reasoning as a pre- and post-test in multiple sections of experimental (active, inquiry-based learning) and control (passive lecture) courses taught by several instructors teaching in similar classrooms.

The active, inquiry based classes emphasized processes such as making observations, posing questions, analyzing data, making predictions, and communicating ideas. Students in these classes worked together in groups to complete learning exercises that included conceptual multiple-choice questions (conceptests), Venn diagrams, evaluation rubrics, concept maps, and open-ended questions. The learning was structured to scaffold learning by beginning with exercises that employed concrete examples and later moved students toward more abstract reasoning.

As the graphs below show, traditional lecture instruction had no significant impact on transforming concrete thinkers, whereas the number of students functioning as abstract thinkers increased by 28% and concrete thinkers decreased by 50% in active-learning classrooms. The study suggests, therefore, that reasoning capacity is affected by how students learn science content.

---

Lessons in Learning from Gateway STEM Courses
An Example from Biology

For more than 30 years, policy makers and professional organizations have been calling for an increase in the number of underrepresented minority groups within the STEM disciplines. Nonetheless, even when successfully recruiting minority students into the undergraduate gateway STEM courses, achievement gaps remain large and these students have lower persistence rates, especially when also identified as first-generation-to-college and from low-income families. Many universities respond with interventions that enhance tutoring, mentoring, research, and financial-aid opportunities for targeted students. Although these programs point to short-term successes, they have largely relied on external funds and are rarely sustained.

The University of Washington encouraged more sustainable approaches to diminish the achievement gap. The Biology Department examined the impact of instructional strategies in the gateway course for majors\(^1\). Faculty identified 3 course structures: Low: Emphasis on lecturing; inclusion of questions with answers solicited from students who voluntarily raised their hands or responded using clickers; occasional use of ungraded think-pair-share questions, minute papers, or question sets completed by informal groups. Medium: Lectures supplemented with daily graded clicker questions that elicited interactivity through peer instruction; weekly peer-graded short-answer questions completed and graded with a strict time limit. High: “Lecture-free” with the elements of medium-structure classes plus weekly class note summaries; reading quizzes testing understanding of basic vocabulary and concepts prior to each class; daily in-class questions addressed to groups.

The biology researchers assessed the impact of these classroom structures by using previous analyses showing that a student’s course grade could be predicted from SAT-Verbal score and college GPA at the time of course enrollment. The impact on the achievement gap was assessed by separately tracking students in the university’s Educational Opportunity Program (EOP); EOP participants are from educationally or economically disadvantaged backgrounds and most are first generation to college. About 76% of EOP students are from under-represented minorities, and the majors-Biology course typically includes 15-20% EOP students.

The first graph at right shows how high-structured course experiences improved grade achievement, relative to predicted grade, for both EOP and non-EOP students. The vertical scale is the difference of predicted and actual grade on a 4-point scale. Differences in predicted and actual grade (“performance” on the graph) between EOP and non-EOP students indicates an achievement gap related to course attributes rather than preparation measured by SAT or GPA. This gap is smaller in the high structure course and the overall performance of EOP students relative to the prediction in the high-structured courses matches the achievement for non-EOP students in the low-structured courses, i.e., the larger achievement gap in the low-structure courses primarily relates to the course structure not to EOP-student ability.

The second graph shows the impact of course structures implemented by a single instructor. In this case, the vertical scale shows the achievement gap between EOP and non-EOP students. In the low-structured classes, however, this gap is about 1/3rd of a grade whereas in the high-structured classes this disparity is minimal (bars are 95% confidence intervals).

The study shows, therefore, that replacing lecture with active, student engagement in learning improves overall course performance regardless of preparation and diminishes achievement gaps through incorporation of more inclusive pedagogy.

---

\(^1\) Haak et al., 2011, Science 332:1213-1216
Universities across the country have been paying increased attention to improving student outcomes in mathematics. Decreased levels of student preparation for college-level mathematics have negatively impacted development of quantitative skills and progress into mathematically rigorous disciplines, such as the STEM fields. Black Hills State University addressed this problem through a systematic, assessment-driven course redesign of College Algebra\textsuperscript{1}.

The Black Hills State faculty started with surveys of faculty and students that identified two problems: First, calculus instructors felt that a major reason for failure in calculus was a lack of understanding of algebraic and trigonometric processes. Many of the calculus students were able to complete problems only when the steps involving algebraic or trigonometric prior knowledge were isolated. Therefore, one project goal was to assure that students understood the processes of algebra to the point of automaticity if they were going to become more effective problem solvers in subsequent classes. Second, surveys of students showed low self-efficacy—self-judgment of one’s capabilities to organize and execute the courses of action required to attain designated performance. Successes build self-efficacy and failures undermine it. However, if success is too easily attained, then students do not learn that sustained effort is necessary to overcome the difficulties that they may encounter later. Therefore, the project emphasized a component of mastery learning where students learn that they can struggle, and then organize and execute plans to succeed. The hypothesis was that if students do not learn that they can succeed when they are challenged, then they might change their major if they do not think that they can succeed in subsequent math and quantitative science courses.

The college-algebra faculty systematically and incrementally implemented and assessed each intervention in steps. They started with incorporating a computer-based mastery-learning program where students did self-paced, online homework and spent one class period in a computer lab with the instructor to get assistance on the most challenging topics. Other class periods were reconstituted to progressively replace most lectures with modules on the historical development of concepts, whole-class discussions, and cooperative problem solving activities with an emphasis on relevant applications. Rather than presenting lectures, instructors tracked their time answering questions, modeling the processes for solving a problem, discussing with students the theoretical aspects of math within an historical, human-interest perspective, applying mathematics to potential applications, and discussing the relevancy of mathematics to other disciplines and the real world.

The project progressed in an iterative process of changes, assessment of learning and self efficacy, consultation of the research literature on learning for guidance, and a process of adjusting in the face of what these efforts revealed. Throughout the process, the faculty focused on why students needed college algebra. To be successful in other courses outside of the department, students needed to understand both the concepts (i.e., solving equations, statistical analysis procedures, and logarithmic and exponential functions) and the processes (i.e., modeling, problem-solving, communication, and analysis) of college algebra.

Over the 5 years of incremental implementation and improvement, the passing rate (C or higher) rose from 54% to 75%, there was a 300% increase in enrollment in the next mathematics course (trigonometry), a 25% improvement in attendance, and a statistically significant increase in competency as measured by a nationally normed proficiency test. Surveys implied that improved attendance and progress to additional math classes was a consequence of improved self-efficacy resulting from mastery-learning strategies and an emphasis on the relevance of learning mathematics at the deep, conceptual level rather than memorizing problem-solving steps.

As the graph below shows, these changes were not instantaneous. The greatest gains were achieved after all components were deliberately set in motion, assessed and revised. There was also a “learning curve” for the faculty to most effectively implement and integrate all components of the new curriculum and pedagogy.

\textsuperscript{1} Hagerty et al., 2010, Primus, 20(5): 418–437
Teachable Unit Guide

Project for Inclusive Undergraduate STEM Success
Building a Teachable Unit

The term “teachable unit” is borrowed from work in the instructional design of college science courses by Jo Handelsman and colleagues at the University of Wisconsin. A teachable unit contains the instructional materials that enclose the activities, assignments, and assessments intended to achieve learner mastery of an essential concept (or a course-level learning outcome). A teachable unit may be a plan for one class period, one week, or some other part of the whole course. The teachable unit (a) is built backwards from assessable outcomes, (b) incorporates evidence-based and research-informed pedagogical strategies, and (c) facilitates dissemination of the curriculum design by containing all of the information that another instructor would need to teach the unit in order to. An effectively designed (redesigned) course consists of a collection of teachable units.

Define the Teachable Unit

1. Give the teachable unit a title that reflects the essential course concept (or course outcome):

2. How long will it take to complete the unit (e.g., number of class periods, days...)?

State the Student Learning Outcomes of the Teachable Unit (What should students learn?)

3. What is(are) the essential learning outcome(s) for the unit? How do these outcomes connect to (or scaffold to) one or more learning outcomes for the course?

<table>
<thead>
<tr>
<th>Teachable Unit Outcome</th>
<th>Related Course Outcome (number)</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.</td>
<td></td>
</tr>
<tr>
<td>B.</td>
<td></td>
</tr>
<tr>
<td>C.</td>

<td></td>
</tr>
<tr>
<td>F.</td>
<td></td>
</tr>
</tbody>
</table>

Before moving on: “Bloom” each unit-level outcome and related course-level outcome on your Bloom poster.
The Implications of Learners’ Prior Knowledge

4. What previous experiences do students have with the content, methods, analysis, etc. that you wish to include in this unit? Be sure to consider these experiences, which you anticipate from previous courses or earlier in the current course, as jumping-off points when you design the unit (start where the learner is situated).

5. What are the students’ bottlenecks to learning this content and outcomes? In other words (if you’ve had experience teaching this material), what do students repeatedly fail to learn and/or what misconceptions are difficult to change? Keep these bottlenecks in mind for special consideration as you design learning activities.
Developing Questions for Peer Instruction with Clickers*

Research shows student grades, accomplishment of learning outcomes, and interest in subject matter all increase when clickers are effectively used, especially in large lecture classes (Center for Effective Teaching). Peer instruction with clickers is one of the most accessible ways of transforming a lecture presentation into an interactive presentation instruction and provides immediate feedback to the instructor on whether or not students are understanding the material.

In the space below, develop at least 3 peer-instruction questions. For each question include 3-5 potential answers. Well written questions and answer options should be: 1) clear, 2) connect to the content and learning outcomes of the class, 3) be of the appropriate difficulty, and 4) stimulate thoughtful discussion among students because the question (and distractor answers) address common misunderstandings, misconceptions, and errors so that 30-70% of initial answers are incorrect (Peter Newbury, Center for Teaching Development, University of California, San Diego).

1.

2.

3.

*Even if not using peer instruction, these questions can be used for think-pair-share and other interactive learning approaches.
Constructing the Learning Activity Sequence *(How should students learn?)*

In-Class Learning. What must students do during class time in order to accomplish the outcomes of the unit?

6. Consider this questionnaire before digging into the details:

<table>
<thead>
<tr>
<th>What proportion of class time will be allocated for lecture?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Will peer instruction, think-pair-share, write-pair-share, etc. be used during lecture?</td>
</tr>
<tr>
<td>What proportion of class time will be allocated for constructive learning activities?</td>
</tr>
<tr>
<td>What proportion of class time will be allocated for interactive learning activities?</td>
</tr>
<tr>
<td>What is the highest intended level of cognitive processing (Bloom’s taxonomy) for in-class activities?</td>
</tr>
<tr>
<td>Will the instructor explore students’ existing knowledge?</td>
</tr>
</tbody>
</table>
7. List and briefly explain what students will experience in class and connect it to the learning objective of the experience; *be sure that these objectives link to the unit and course outcomes*. Remember that class time is an opportunity to focus on *interactive learning* with judicious use of instructor explanation (Provide the *ICAP* identity for each experience).

Place these activities and experiences in chronological order or number them after you list them to show the intended sequence. Each experience (middle column) should have a clear objective (left column) that forms part of a pathway to meeting the learning outcomes (#3). If your teachable unit is longer than one class day, be sure to indicate which activities and experiences belong to each day of class.

<table>
<thead>
<tr>
<th>What students need to learn, and ...</th>
<th>... the experience where they will learn it.</th>
<th>I, C, A, or P</th>
</tr>
</thead>
</table>

...
In-Class Learning (continued)

<table>
<thead>
<tr>
<th>What students need to learn, and...</th>
<th>... the experience where they will learn it.</th>
<th>I, C, A, or P</th>
</tr>
</thead>
</table>

Before moving on: “Bloom” each activity on your Bloom poster.
Pre-Class Learning Assignment. What do students need to know or do before coming to class in order to achieve the expectations you have for class time each day; i.e., what do students need to do to individually activate learning prior to class?

8. Consider this questionnaire before digging into the details:

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>What, if anything, will students do before class?</td>
<td></td>
</tr>
<tr>
<td>How much time do we expect the “typical” student to spend on pre-class preparation?</td>
<td></td>
</tr>
<tr>
<td>Will we guide the pre-class work (e.g., expected learning outcomes, guiding questions, muddy-point question)?</td>
<td></td>
</tr>
<tr>
<td>How, if at all, will pre-class learning be assessed?</td>
<td></td>
</tr>
<tr>
<td>What is the highest intended ICAP level for pre-class activities?</td>
<td></td>
</tr>
<tr>
<td>What is the highest intended level of cognitive processing (Bloom’s taxonomy) for pre-class activities?</td>
<td></td>
</tr>
<tr>
<td>Will the instructor explore students’ existing knowledge?</td>
<td></td>
</tr>
<tr>
<td>Will the instructor use information about students’ pre-class learning during in-class instruction?</td>
<td></td>
</tr>
</tbody>
</table>
9. Each experience (middle column) should have a clear objective (left column) that prepares students for in-class learning (#7). Remember that pre-class learning will be better retained if it includes more than passive engagement with text or media (Provide the ICAP identity for each experience). If your teachable unit encloses more than one-day of class, be sure to break down this list for each day to assure preparation for the upcoming day of in-class learning. For each assignment component (e.g., reading, video, simulation) write the guiding questions that will provide the roadmap for student achievement.

<table>
<thead>
<tr>
<th>What students need to learn, and ...</th>
<th>... the experience where they will learn it.</th>
<th>I, C, A, or P</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
10. **Pre-Class Learning Accountability.** How will you hold students accountable for pre-class learning that is necessary for successful in-class learning? Briefly explain your strategy here and then go back to items 7 and 9 and be sure that you have included these accountability plans in your unit design.
Post-Unit (Class) Learning. What do students need to do outside of class after the unit (or at key points within a long unit) in order to solidify their learning?

11. Consider this questionnaire before digging into the details:

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>Will there be post-class assignments?</td>
<td></td>
</tr>
<tr>
<td>How much time do we expect the “typical” student to spend on post-class assignments?</td>
<td></td>
</tr>
<tr>
<td>Will students receive feedback on their post-class learning?</td>
<td></td>
</tr>
<tr>
<td>How, if at all, will post-class learning be assessed?</td>
<td></td>
</tr>
<tr>
<td>What is the highest intended ICAP level for post-class activities?</td>
<td></td>
</tr>
<tr>
<td>What is the highest intended level of cognitive processing (Bloom’s taxonomy) for post-class activities?</td>
<td></td>
</tr>
<tr>
<td>Will the instructor use information about students’ post-class learning during in-class instruction?</td>
<td></td>
</tr>
</tbody>
</table>
12. What do you plan to assign students to do (middle column) and how will each learning outcome (#3) be included (left column)? Remember that post-class learning will be better retained if it includes more than passive engagement with text, media, or notes (Provide the ICAP identity for each experience).

<table>
<thead>
<tr>
<th>What students need to learn, and ...</th>
<th>... the experience where they will learn it.</th>
<th>I, C, A, or P</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Assessing Student Learning Achievement (*How will we know that students learned?*)

Each learning outcome for the unit should be *formatively* assessed at least once and also *summatively* assessed.

13. **Formative Assessment.** For each lettered teachable unit outcome (left column), describe (middle column) the formative assessment tools (e.g., clicker question, in-class assignment response, reflective writing, low-stakes quiz) for checking knowledge gain and where in the learning activity sequence each formative assessment will occur (right column)

<table>
<thead>
<tr>
<th>Teachable Unit Outcome</th>
<th>Formative Assessment Tool</th>
<th>Pre-, In, Post-Class?</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>B.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>C.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>D.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>E.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>F.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
14. **Summative Assessment.** For each lettered teachable unit outcome (left column), describe (middle column) the summative assessment tools (e.g., exam question, project rubric, report rubric) for checking knowledge gain, and how that assessment will also, if applicable, assess course-level outcomes (right column).

Although only course-level outcomes technically need to be summatively assessed it is usually beneficial for guiding student studying for high-stakes exams and preparation of other high-stakes reports, if they see the scaffolding steps of the unit-level outcomes within their assessments. You can also work this table backwards by including the summative assessment tool for a course-level outcome and then determining how it simultaneously assesses one or more unit-level outcomes.

<table>
<thead>
<tr>
<th>Teachable Unit Outcome</th>
<th>Summative Assessment Tool</th>
<th>Also assesses course-level outcome? Which one?</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>B.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>C.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>D.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>E.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>F.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Before moving on: “Bloom” each formative and summative assessment on your Bloom poster.
Alignment

Are all of the …
… learning outcomes,
… learning experiences, and
… assessments aligned?!!

15. The first way to check alignment is to be sure that you have included learning activities, formative assessments, and summative assessments for each teachable-unit learning outcome. Fill out the table below by utilizing (i.e., copying/pasting) your previous responses. This table will serve as a summary, at-a-glance view (teaching plan) of the components of your teachable unit.

<table>
<thead>
<tr>
<th>Teachable Unit Learning Outcome</th>
<th>Learning Activities</th>
<th>Assessment of Learning</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.</td>
<td>Pre-class:</td>
<td>Formative:</td>
</tr>
<tr>
<td></td>
<td>In-class:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Post-class</td>
<td>Summative:</td>
</tr>
<tr>
<td>Teachable Unit Learning Outcome</td>
<td>Assessment of Learning</td>
<td></td>
</tr>
<tr>
<td>---------------------------------</td>
<td>------------------------</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Formative:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Summative:</td>
<td></td>
</tr>
<tr>
<td>B.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>C.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Teachable Unit Learning Outcome</td>
<td>Learning Activities</td>
<td>Assessment of Learning</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td></td>
<td>Pre-class:</td>
<td>Formative:</td>
</tr>
<tr>
<td></td>
<td>In-class:</td>
<td>Summative:</td>
</tr>
<tr>
<td></td>
<td>Post-class</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Pre-class:</td>
<td>Formative:</td>
</tr>
<tr>
<td></td>
<td>In-class:</td>
<td>Summative:</td>
</tr>
<tr>
<td></td>
<td>Post-class</td>
<td></td>
</tr>
<tr>
<td>D.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>E.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>F.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
16. Look at your Bloom’s Taxonomy Poster and answer these questions. If any answer is “no”, make a note for how you can adjust the teachable unit in order to better align the levels of thinking and types of knowledge that will be constructed.

<table>
<thead>
<tr>
<th>Question</th>
<th>Yes</th>
<th>No</th>
<th>How to adjust</th>
</tr>
</thead>
<tbody>
<tr>
<td>Are the teachable-unit learning outcomes at the same level as the related course learning outcome(s), or are the teachable-unit learning outcomes an appropriate, scaffolded path toward eventual achievement of the related course learning outcome(s)?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do the learning activities (pre-, in-, post-class) include the same levels of thinking and type of knowledge as the intended teachable-unit learning outcomes?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do the formative assessments include the same levels of thinking and type of knowledge as the intended teachable-unit learning outcomes?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do the summative assessments include the same levels of thinking and type of knowledge as the intended teachable-unit learning outcomes?</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Do the summative assessments match the levels of thinking and type of knowledge that students have experienced through learning activities and formative assessment?</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Evaluating the Teachable Unit

Apply the “Review Rubric for Teachable Units” (from Handelsman et al., *Scientific Teaching*) to rate your teachable unit and identify possible changes that would improve the rating.

<table>
<thead>

Seven Principles for Good Practice in Undergraduate Education

Good practice in undergraduate education:

1. **Encourages Contact Between Students and Faculty** Frequent student-faculty contact in and out of classes is the most important factor in student motivation and involvement. Faculty concern helps students get through rough times and keep on working. Knowing a few faculty members well enhances students' intellectual commitment and encourages them to think about their own values and future plans.

2. **Develops Reciprocity and Cooperation Among Students** Learning is enhanced when it is more like a team effort than a solo race. Good learning, like good work, is collaborative and social, not competitive and isolated. Working with others often increases involvement in learning. Sharing one's own ideas and responding to others' reactions sharpens thinking and deepens understanding.

3. **Encourages Active Learning** Learning is not a spectator sport. Students do not learn much just by sitting in classes listening to teachers, memorizing pre-packaged assignments, and spitting out answers. They must talk about what they are learning, write about it, relate it to past experiences and apply it to their daily lives. They must make what they learn part of themselves.

4. **Gives Prompt Feedback** Knowing what you know and don't know focuses learning. Students need appropriate feedback on performance to benefit from courses. When getting started, students need help in assessing existing knowledge and competence. In classes, students need frequent opportunities to perform and receive suggestions for improvement. At various points during college, and at the end, students need chances to reflect on what they have learned, what they still need to know, and how to assess themselves.

5. **Emphasizes Time on Task** Time plus energy equals learning. There is no substitute for time on task. Learning to use one's time well is critical for students and professionals alike. Students need help in learning effective time management. Allocating realistic amounts of time means effective learning for students and effective teaching for faculty. How an institution defines time expectations for students, faculty, administrators, and other professional staff can establish the basis of high performance for all.

6. **Communicates High Expectations** Expect more and you will get more. High expectations are important for everyone -- for the poorly prepared, for those unwilling to exert themselves, and for the bright and well-motivated. Expecting students to perform well becomes a self-fulfilling prophecy when teachers and institutions hold high expectations for themselves and make extra efforts.

7. **Respects Diverse Talents and Ways of Learning** There are many roads to learning. People bring different talents and styles of learning to college. Brilliant students in the seminar room may be all thumbs in the lab or art studio. Students rich in hands-on experience may not do so well with theory. Students need the opportunity to show their talents and learn in ways that work for them. Then they can be pushed to learn in new ways that do not come so easily.
STEM Gateway
Course Redesign Teaching Professional Development Program:

Teaching that Supports Diverse Learners

- What is inclusive pedagogy?
- How can we easily adjust instruction to embrace diverse learner experiences and approaches to learning that improve student success?
- What do the data show about culture-based differences in learning and about instruction that reduces achievement gaps?
Teaching that Supports Diverse Learners

Gary Smith and Audriana Stark
June 2015

Outcomes:

You will be able to:

1. Describe some of the demographic/socioeconomic characteristics of UNM students that impact teaching and learning.

2. Evaluate yourself and your course in terms of cultural constructs of teaching and learning
   a) Describe the cultural constructs of teaching and learning
   b) Plot your teaching approach, course, and students on the cultural constructs spectrum.
   c) Determine ways of adjusting instruction across the spectrum and for helping students to “swing” across the spectrum.

3. Evaluate your classroom climate
   a) Self-assess the inclusiveness of your course
   b) List ways to make the course more inclusive
What are the implications of cultural and ethnic diversity for how you teach your course?

What other types of diversity are represented by your students?

STEM Gateway research shows that some populations are less likely to persist in STEM majors at UNM

1503 first-time full-time freshmen entered UNM in the fall semesters of 2005, 2006, and 2007 with the intention of completing a STEM degree

Hispanic STEM students are 0.65 times as likely to graduate with STEM degrees than non-Hispanic students

Female STEM students are 1.36 times as likely to switch majors out of STEM than male students. (And, incoming freshmen women are only about half as likely as men to be interested in pursuing STEM)

Socioeconomic status matters more than SAT/ACT score for determining student persistence to graduation.

UNM students are, compared to the national college-student population, more likely to be financially under-resourced

New Mexico ranks 42nd in median family income.
37% of UNM undergraduates received Pell Grants in Fall 2009 (more than any other public flagship university, which average ~20%)

**Source:** Profile of the American College Student, 2008; UNM-OIR
Socioeconomic status affects STEM degree completion at UNM

Pell-Eligible STEM students are 1.43 times as likely to stop attending UNM and are .46 times as likely to graduate than non-Pell-eligible students.

First Generation STEM students are 1.62 times as likely to stop attending UNM and are .42 times as likely to graduate than non-First Generation students.

UNM students work more hours (primarily off campus) than the average US college student

UNM students are more likely than their national peers to be working to support themselves, their family, or both

UNM students are more likely to be care givers in their families

About 40% of UNM freshmen and 50% of seniors provide care to parents, children, and/or siblings (16% of seniors commit >30 hrs/wk to this obligation).

Source: Profile of the American College Student, 2008

Source: 2009 NSSE
UNM student preparation compares well with national data (based on ACT scores) …

… but student preparation for science and math courses lags other fields.

Personal concerns and teaching quality are the primary variables determining UNM student attendance.

What is the main reason why you miss/skip class?
UNM’s first-generation students benefit disproportionately from engaging pedagogy

Approximately 44% of UNM undergraduates are first-generation college students; at least 25% are first in their family to attend college.

Educationally Purposeful Activities:

- Asked questions in class or contributed to class discussions
- Made a class presentation
- Prepared two or more drafts of a paper or assignment before turning it in
- Come to class unprepared (reverse coded)
- Worked with other students on projects DURING CLASS
- Worked with classmates OUTSIDE OF CLASS to prepare class assignments
- Tutored or taught other students (paid or voluntary)
- Participated in a community-based project (e.g., service learning) as part of a regular course
- Used an electronic medium (listserv, chat group, Internet, instant messaging, etc.) to discuss or complete an assignment
- Used e-mail to communicate with an instructor
- Discussed grades or assignments with an instructor
- Talked about career plans with a faculty member or advisor
- Discussed ideas from your readings or classes with faculty members outside of class
- Received prompt written or oral feedback from faculty on your academic performance
- Worked harder than you thought you could to meet an instructor's standards or expectations
- Worked with faculty members on activities other than coursework (committees, orientation, student life activities, etc.)
- Discussed ideas from your readings or classes with others outside of class (students, family members, co-workers, etc.)
- Had serious conversations with students of a different race or ethnicity than your own
- Had serious conversations with students who are very different from you in terms of their religious beliefs, political opinions, or personal values
Active learning increases student learning and decreases achievement gap

Educational Opportunity Program (EOP) students are from educationally or economically disadvantaged backgrounds; most are first generation to college; 76% are from underrepresented minorities

Regression of all students’ incoming GPA and SAT verbal score predicts course grade

Instructional format (same instructor) affects actual learning

Haak et al., Increased structure and active learning reduce the achievement gap in introductory biology, Science, June 3, 2011

Active learning increases student learning and decreases achievement gap

**HOW DO YOU ENTER THE LEARNING PROCESS?**
**WHERE DO YOU FALL IN THIS TABLE?**

Ways of knowing, sources of knowledge, styles of learning, roles of teacher and learner and other aspects of the learning process vary among people and, in part, relate to life experiences and cultural context and identity of the learner. For each of the rows in this table, mark an X where you think you fall. Notice, this isn’t “black and white”, so you may decide your preference for some items lies somewhere between the two extremes. That’s normal! Just mark an X using the two sides of the central column as the ends of the spectrum and note where you are within this spectrum. Then, mark an ‘O’ where your experiences of how STEM-gateway courses are taught fall on the spectrum in each applicable row.

Based on the work of Alicia Chavez, UNM, (Chávez, Ke & Herrera, 2009) adapted from Burton (2009); Cajete (1994); Chávez (2008); Guido-DíBrito and Chávez; Ibarra (2001); and Rendón (2009)
# THE CLASSROOM CLIMATE

Choices in how to organize class time, design learning experiences, and assess learning range widely among instructors but typically vary little for a single instructor. But classes consist of students who bring diverse backgrounds, capabilities, and traditions of learning that may not be wholly compatible with the narrow range of instructional choices used by a teacher. How teachers intend learning to occur and how that learning is assessed can be viewed as being more or less inclusive of different types of students and more or less accessible for all learners, while also minimizing or maximizing the opportunities for students to learn from their diverse peers. For each of the rows in this table, mark an X where you think you plot on the inclusivity spectrum.

<table>
<thead>
<tr>

*Misconceptions about learning impede student success*

Could it be that students lack adequate comprehension of written text or how to learn from text?

Students don’t spontaneously self-quiz in order to evaluate their learning and, as a result, are overconfident of learning from text.

(Dunlosky, et al., 2002, in Perfect and Schwartz, eds., Applied Metacognition)

Re-reading does not significantly increase learning although students perceive that their learning increases

“How well do you think you will be able to answer test questions over this material?

0 (definitely won’t be able), 20 (20% sure I will be able), 40 ... 60 ... 80 ... 100 (definitely will be able)”

Re-reading does not significantly increase learning although students perceive that their learning increases

Considering what was presented, what can you do to improve student learning?

“There seemed to be a mystifying universal conspiracy among textbook authors to make certain the material they dealt with never strayed too near the realm of the mildly interesting . . .”

– A Short History of Nearly Everything, Bill Bryson

Do students know what is important when they read technical text?

Faculty, seniors, and freshmen read a 100-sentence genetics research article and were instructed to highlight sentences containing important information.

Faculty unanimously agreed that …

… 11 sentences were important

… 43 sentences were unimportant

What did the students think?

Students have difficulty determining what is important when reading

Preparing the learner enhances use of memory

Count all of the vowels in the words on the next slide in 45 seconds.

45 seconds

Activity from Saundra McGuire, Louisiana State University.
How many words or phrases do you remember?

A. 15
B. 10-14
C. 5-9
D. 1-4
E. 0

Let's look at the words again...

What is the scheme for the order of the items?

Dollar Bill Cat Lives
Dice Bowling Pins
Tricycle Football Team
Four-leaf Clover Dozen Eggs
Hand Unlucky Friday
Six-Pack Valentine’s Day
Seven-Up Quarter Hour
Octopus
NOW, How many \textit{words} or \textit{phrases} do you remember?

A. 15  
B. 10-14  
C. 5-9  
D. 1-4  
E. 0

What were two major \textit{differences} between the two attempts?

1. We knew what the task was  
2. We knew how the information was organized

Activity inspired by Saundra McGuire, Louisiana State University

Consider the benefits of providing \textbf{structured reading assignments and guiding questions}

![Graph showing mean proportion correct on essay test]

Guiding questions:
- Completed
- Not completed

Consider what was presented, what can you do to improve student learning?
Long-term learning benefits from interleaving learning topics
Example from mathematics:
- Tutorial/Practice/Test on problem types

"Mixers"
- Tutorial on all 4 topics
- 16 practice problems randomly ordered among topics
- 1 week
test problems, all 4 topics

"Blockers"
- Tutorial on 1 topic
- 4 practice problems on single topic
- 1 week
test problems, all 4 topics

Instructional Science 35(6): 481–498

Considering what was presented, what can you do to improve student learning?

Students are not necessarily experienced, or skilled at taking notes

In national surveys, 66.5% of incoming freshmen indicate that they frequently took notes in class during the past year.

Studies show that student notes during lectures generally record no more than half of the key presented concepts.
Providing *skeletal notes* supports more learning than posting full notes

![Graph showing test score percentage for control, provided skeletal notes, and provided full notes](https://s-media-cache-ak0.pinimg.com/originals/80/92/2a/80922a6f47d8f06e02433f53a38332af.jpg)

Students are not necessarily accustomed to asking for help

Speaking up in public requires confidence. In polls, Americans generally rank fear of “speaking in front of many people” on par with “dying” and “losing all of my money.”

In national surveys, only 59% of incoming freshmen indicate that they frequently asked questions in class during the past year. During the freshman year, this falls to 34%.

Source: The American Freshman, National Norms 2009; HERI, UCLA

Students are not necessarily accustomed to asking for help

In a 2010 survey of 2650 UNM undergraduates, 60% never met with the instructor outside of class and 19% only did once.

Source: Title V-OSET survey data

All questions are *not* created equal

3. Find x.

Image at: https://s-media-cache-ak0.pinimg.com/originals/80/92/2a/80922a6f47d8f06e02433f53a38332af.jpg
Bloom’s taxonomy describes the types of thinking and learning we want to achieve.

**Cognitive process:** What the learner does:

1. **Remember**
   - Recalls or recognizes information: facts, definitions, generalizations

2. **Understand**
   - Constructs meaning by interpretation, classification, comparing, explaining, summarizing

3. **Apply**
   - Use methods, concepts, principles, theories in new situations; solve realistic problems that require the identification of issues and use of appropriate generalizations and skills.

4. **Analyze**
   - Identifies how parts relate to one another or to a larger structure or purpose; considers available evidence to reach a conclusion, inference or generalization

5. **Evaluate**
   - Judges the value of something by application of criteria, processes, or standards.

6. **Create**
   - Brings together parts to form a new whole or solve a problem that requires new creative thinking.

**How students answered**

At what level of Bloom’s did you have to operate to make A’s or B’s in high school?

1. Remember
2. Understand
3. Apply
4. Analyze
5. Evaluate
6. Create

**How students answered**

At what level of Bloom’s do you think you’ll need to be to make an A in Chemistry I?

1. Remember
2. Understand
3. Apply
4. Analyze
5. Evaluate
6. Create

How can you help students recognize the type of thinking required to solve the problems?

An example from Biology; provided by Angela Hung
“Effective faculty members understand that students learn in very different ways.”

Three things that you should know about “learning styles”

Learning preferences are reliably and validly measured by some instruments.

Students are not necessarily disadvantaged by instructional strategies that are contrary to their learning-style preference.

There is evidence that some learning-style preferences are rooted in cultural experience and may, therefore have an affective impact on learning.

Considering what was presented, what can you do to improve student learning?
Learning-preference diversity has implications for your teaching

Your students may not prefer to learn, or think, the same way that you do. Some of these differences are likely rooted in cultural experience. No single instructional approach engages learning equally for all of your students.

Adopt multiple methods, where appropriate, to enhance learning and to provide variety that maintains student interest.

I anticipate that students will readily understand how to maximize their learning within the structure of the redesigned course (e.g., pre-class, in-class, post-class learning opportunities and expectations)

A. Strongly agree
B. Agree more than disagree
C. Disagree more than agree
D. Strongly disagree

Learning process flow chart used in G. Smith’s geology classes

Returning to the workshop outcomes:

After completing this workshop, participants will be able to:

- Use evidence to support why students may struggle to demonstrate their learning in your course
- Describe an assignment for helping your students learn about learning
- Integrate a learning-to-learn strategy with existing course content into at least one “teachable unit”

Choose one outcome and briefly summarize how one or more activities during this workshop have helped you achieve, or progress toward achieving, this outcome.

Learning Outcome Log (LOL) – Chris Burnham, NMSU
Do your students, and you, know what approaches to studying are most effective for learning?

Assignment for Monday’s Class: Introduction to Ground Water Contamination

Objectives: This is the first of several class sessions where you will develop an understanding for how harmful contaminants, of natural or human origin, move through aquifers and cause potential risk to drinking-water supplies. Each topic builds on its predecessors and integrates your previous learning about methods for determining the direction and velocity of fluid flow in aquifers. After this class session you will be able to explain (a) why contaminant concentrations vary from place to place and (b) one method for remediating contamination. (Related to mastery of student learning outcomes 2 and 4 for the course)

Before starting to read: “Wake up” your brain to what you already know; the most important determinant of learning is what you already know.

• Jot down on a sheet of paper the ideas and concepts that you already know about how contaminants get into ground water and move in ground water.
• Now, write down questions that you have about ground water contamination. Be watchful to learn the answers to these questions over the next week.

Reading resources:

Smith, G.A., 2013, Some concepts of chemical transport in ground water, unpublished, 5 p. [Note: This short reading will be used frequently in coming weeks, including considerably during completion of Research Problem 2 – read it carefully for understanding!]

Class Preparation Assignment: Understand - Know the answers to these questions before coming to class

• What geological characteristics of an aquifer affect the distribution of contaminants in the environment?
• The terms contaminate and contaminant are commonly misused in student writing for this course. Start working now on your thinking about these terms so that you don’t lose points on upcoming assignments! Write out your own definitions of each term.
• Define dispersion and retardation.
• What is point-source contamination as opposed to nonpoint-source contamination?
• What is remediation?
• Explain ground-water-flow reversal as part of a remediation effort.
• Outline how you might apply the ground-water-flow reversal technique to the Babylon landfill site (Lundgren, p. 386-388).

View these short (30-60 seconds) animations, which are available on the "Presentations" page within "Online Library."

"Contaminant Transport"
"Contaminant Breakthrough"
"Dispersion"
"Retardation"

In-Class Learning

• Short discussion to explore your understanding of contaminant transport principles
• Group exercise (in My Groups) to use these principles to explain characteristics of a real contaminant plume (InClass 5-Understanding and remediating ground-water contamination)
An example of how Bloom’s Taxonomy was integrated into a Biology course - Angela Hung, UNM Biology

Instructions to students:

**Module: Problem Solving- Recognizing the Required Thinking and Learning Using Bloom’s Taxonomy**

**Objective:** Not all questions are alike. Some questions are what we call “find the answer” others are “make the answer”. Understanding the type of question being asked and the required thinking to answer the question is critical not only to assure that you answer the question correctly but also to assure that you achieve the learning that was intended by asking the question in the first place.

**Pre-Class Assignment:**

1. **Part One – Basics of Learning; Chapter #4 – Cognitive Domain—Not All Challenges Are Alike.** This short reading introduces you to Bloom’s Taxonomy, a classification of the types of thinking that are required to achieve learning that is progressively more demanding and sophisticated. The reading includes short exercises to familiarize you with Bloom’s Taxonomy.

2. **Print, read, and bring to class: “Discovery of Photosynthesis.”** We will use this illustrated reading to complete an exercise during class, so you’ll need to read and think about it in advance.

**During Class:**

- We will discuss the reading about how biologists discovered photosynthesis and reflect on the cognitive processes (the levels of Bloom's Taxonomy) that you would use if you had to learn this topic for a test. We will also see how the scientists engaged in the scientific method and used Bloom’s cognitive processes in order to discover photosynthesis.

**Procedure for In-Class Assignment:**

- A PowerPoint presentation (a version of the student handout on the Discovery of Photosynthesis) highlights four major experiments that contributed to understanding photosynthesis.
- Go through each major experiment one at a time.
  - For each experiment, have the students identify the question, hypothesis and predictions of that study.
  - Then have students interpret the results and state their conclusions
  - Show the class what the scientist concluded from their results. Do they match?
- At the end of the slideshow, remind students of each of the cognitive processes identified by Bloom’s Taxonomy.
- In small groups, students fill out a blank Bloom’s Taxonomy table in which they come up with questions and answers about the discovery of photosynthesis that fit each level of the taxonomy (example answers on next page)

**Questions for Student Reflection:**

1. How does your understanding Bloom’s Taxonomy of Learning impact the way you approach answering questions or solving problems?

2. Educators commonly talk about the importance of “critical thinking.” What does this term mean to you and what levels of Bloom’s taxonomy challenge a learner to think critically?
# Guide to Using Bloom’s Taxonomy of Learning

Example from Angela Hung, UNM Biology TA.

**Objective:** To have students analyze a reading about the history of experiments that defined the process of photosynthesis as an opportunity to (1) explore scientific method and to (2) understand different levels of thinking with the content.

</tbody>
</table>
Journal Prompt about Using Bloom’s Taxonomy in a Chemistry Course: Describe how you would use Bloom’s Taxonomy when you study for a topic in chemistry. Give a specific topic. Feel free to include example questions and answers.

An example student response:

“Bloom’s taxonomy can be applied to just about anything. A person would use Bloom’s taxonomy to help them study and/or better understand the material that they are trying to learn. It would help the learner gain a better understanding of the concepts behind the material.

“A chemistry student could use Bloom’s taxonomy when learning about pressure. The first step in Bloom’s taxonomy would be to remember. This would mean that the student would remember that the definition of pressure is ‘the force exerted per unit area by gas molecules as they strike the surfaces around them.’ They would also learn the formulas related to pressure such as pressure = force/area.

“Next the student would use the step understand. This would be something such as understanding how pressure works. An example of this would be ‘as volume increases, concentration decreases.’

“Next would be the step apply. This could mean giving the student a word problem. The student would then have to pull out the relevant information and plug it into the equation. The student would then carry out the necessary calculations to obtain the correct answer.

“The next step is analyze. Through this step the student will break down what they know. The student could ask the question, ‘Why do I have ear pain when flying on an airplane.’ By analyzing the question, and what they already know about pressure they would conclude that the pressure from the altitude change can cause pressure in the ear.

“Next is the step of evaluation. The student could evaluate how what they learned about pressure measures up against how the world around them acts. For instance, if a person tried to blow up a balloon and it did not work, they could conclude that something that they were taught about pressure is incorrect.

“The last step is to create. The student could use what they have learned about pressure to create an experiment. This could be something along the lines of going up and down a mountain multiple times to see how it effects your ears. The first time the student would just drive to the top and back down. The next time the student could chew gum while going up and down. Next the student could drive very slowly. The next time drive very quickly and so on. This would help the student better understand the relationship of pressure to the altitude and their body.

“Bloom’s taxonomy is a great tool for studying. It is a lot of work, but it creates a level of understanding not usually reached by a student. Utilizing this may be the key to college success.”
1. In-class learning is unique and cannot be experienced without being there. Learning is compromised if you miss the discussions and problem solving opportunities.

2. Class time emphasizes problem solving and discussion that promotes learning by elaboration upon and application of knowledge acquired prior to class. If you’re not completing the reading, then you are diminishing the learning possibility and, perhaps, aggravating your work partners.

3. Answering these questions, especially writing them down, helps you assess that you are prepared for class. Research shows that comprehension of reading increases about 50% when readers self-assess what they learned from a reading. Attempting to answer questions on your own leads to increased learning when you work with the same topic in class with explanations from peers and instructor.

4. Previewing the assignment helps you know if you’re prepared and increases the likelihood of completing the assignment with your team without time stress and with greater focus on learning rather than “get ‘er done”. Thinking about the exercise helps you to start retrieving information from the reading, which strengthens learning. Consider this step the mental calisthenics before starting demanding exercise.

5. If you got this far and still feel unprepared for class, then we should meet to discuss how to enhance your understanding from the previous steps.

6. If you don’t know what you did right or wrong then you really don’t know if have learned anything. We learn most from our mistakes but only when able to get feedback to improve understanding.

7. If you got this far and still feel unprepared for the Learning Checks, then we should meet to discuss how to enhance your understanding from the previous steps. The Learning Checks aid learning by retrieving and elaborating on knowledge that you’ve recently encoded in your brain.

8. If you don’t know what you did right or wrong then you really don’t know if have learned anything. We learn most from our mistakes but only when able to get feedback to improve understanding.

9. You are following the learning process intended for the course

**Tear**

**Name:**

Where did you end at (1-9)?

What will you do differently in the future?
STEM Gateway
Course Redesign Teaching Professional Development Program:

Starting the Semester- Making Sure Learners are on Board with your Redesign

• Are you ready to effectively introduce your redesigned course and expectations on the first day of class?
• How do you get students to value deep learning in your redesigned course?
• How do you get students to “buy into” the responsibility it takes to actively learn, not passively listen, in class?
Starting the Semester
Making Sure Learners are On Board with Your Redesign

Gary Smith and Audriana Stark

Outcomes:
Participants will be able to:

...describe why it is important to get students to buy into active learning and/or team work included in your redesign.
...be prepared to implement at least 2 activities using the Value Expectancy Model to get students invested in active learning and/or team work.

Connect Your Approach to What Learners Value

Answer this question, thinking of what you value in education

What is the most important goal of a college education and, therefore, individual college courses?

A. Acquiring information (facts, principles, concepts)
B. Learning how to use information and knowledge in new situations
C. Developing lifelong learning skills
How do you think undergraduate students answer this question?

What is the most important goal of your college education and, therefore, of this course?

A. Acquiring information (facts, principles, concepts)
B. Learning how to use information and knowledge in new situations
C. Developing lifelong learning skills

How students actually answer this question

What is the most important goal of your college education and, therefore, of this course?

A. Acquiring information (facts, principles, concepts) 7%
B. Learning how to use information and knowledge in new situations 38%
C. Developing skills to continue learning after college 55%

(quantitative n = 1377)
If you have perfect attendance for one semester in this 3-credit course, how many classtime-learning hours will you experience in one semester?

Learning “venues”:

Learning on your own

Learning in class with others

Of the three goals, which do you think you can make headway on outside of class by your own reading and studying, and which do you think would be best achieved in class working with your classmates and me?”
How do learners want to learn?

**Attempt learning on their own, outside of class**

A. Acquiring information (facts, principles, concepts)

B. Learning how to use information and knowledge in new situations

C. Developing lifelong learning skills

**Prefer learning in class, working with peers and instructor**

---

Why might it be potentially useful to conduct this exercise with your students on the first day of class in an active learning classroom?

- Prepare effectively before class
- Participate actively in class

First day of class

~ mid-point of the semester

Photo by Aurira Pun
Where we’re going

Provide a basis for your understanding of “student resistance” to active learning and group work

Provide more classroom-tested tactics for diminishing or removing resistance for your use.

So, although students admit that they learn best in ways that might not be preferred (easier?), small-group work is not highly regarded
What aspects of active-learning classes do students dislike and why?

Students like interactivity of active-learning classes, but dislike added responsibility, including to groups

Changing Biology instruction at Georgetown University

Lecture course:

Liked:
- Traditional course materials: PowerPoint, videos, handouts, outlines
- Quality of instruction: enthusiasm, clarity, and organization

Disliked:
- Lecture not stimulating
- Exams: too hard, too specific, grading
- Subject matter not interesting

Active-learning course:

Liked:
- Quality of instruction: organization, clarity, and interesting
- Additional course materials: learning goals, groups, quizzes
- Interaction in lecture: via group activities, clickers, multiple approaches to learning

Disliked:
- Group work
- Quizzes: points, stressful, too hard

Armbruster et al., 2009, CBE—Life Sciences Education, 8:203–213
Leading to a rich literature on overcoming student resistance working/learning in groups

Productive contradictions: dissonance, resistance and change in an experiment with cooperative learning

HANG IN THERE!
Dealing with Student Resistance to Learner-Centered Teaching

Top 10 reasons students dislike working in small groups . . . and why I do it anyway

Resistance to Cooperative Learning

Group Work Can Be Gratifying: Understanding & Overcoming Resistance to Cooperative Learning

What to do?

“To counter students' resistance, try to persuade them that you are neither playing a game nor performing an experiment, but teaching in a way known to help students learn more and understand better.”

Navigating the Bumpy Road to Student-Centered Instruction,
Richard M. Felder and Rebecca Brent, 1996, College Teaching

When we catch fish, we bait the hook with what the fish like, not what the fisherman likes.

(Gregory and Chapman, 2001)

Image at: http://www.sonofthesouth.net/uncle-sam/images/vegetables.jpg
Achievement motivation relies on *value* and *expectancy*

A goal that I value ...

... and a belief that I can make it!

---

First-day questions ... connect to what students value

What is the most important goal of your college education and, therefore, of this course?

A. Acquiring information (facts, principles, concepts) 7%
B. Learning how to use information and knowledge in new situations 38%
C. Developing skills to continue learning after college 55%

First-day questions for the learner-centered classroom, G.A. Smith, National Teaching and Learning Forum, Sept. 2008
First-day questions ... connect to expectancy

A. Acquiring information (facts, principles, concepts)

B. Learning how to use information and knowledge in new situations

C. Developing lifelong learning skills

Attempt learning on their own, outside of class

Prefer learning in class, working with peers and instructor

How important is it, to you, to develop skills in your coursework that will help you land a job when you graduate?

Can you pick which four in the following list are among the top 5 most desired characteristics among recent college graduates as reported by hiring companies?

1. Creativity
2. Computer skills
3. GPA, cutoff above 3.0
4. Leadership skills
5. Problem-solving skills
6. Teamwork skills
7. Verbal communication skills
8. Written communication skills

Write the numbers for your four choices on the board
1. Creativity
2. Computer skills
3. GPA, cutoff above 3.0
4. Leadership skills
5. Problem-solving skills
6. Teamwork skills
7. Verbal communication skills
8. Written communication skills

GPA, cutoff > 3.0

= employer-desired skill that matches a learning outcome for this course
Describe one or more aspects of this course that you feel might cause anxiety or stress during the semester.

Pick one aspect of working in small groups that is a concern for you. Explain why you have this concern.

No concerns about group work? <15%

Most common concern: “Slackers” (60-80%)
Then, skim through the three links that are listed at the top of the "Team information page" in Learn and seek information that is relevant to your concern.

Write a few sentences that explains how you can help alleviate your concern during the semester.

Resources provided to students:

“Top 10 reasons students dislike working in small groups ... and why I do it anyway”

AnnTaylor

“Coping with Hitchhikers and Couch Potatoes on Teams”

Fact and Fiction: Common Fears about Group Work
Think of something that you’re “good at” other than being a student.

Jot down some thoughts in response to these questions:

How did you become “good at it?”
What role did other people play for you to develop expertise?

Briefly share your answers with your tablemates.

Pay attention to processes and people that are mentioned most often.

List these “common denominators” on a whiteboard

All learning works the same

Repetition (practice) and elaboration (expanding understanding through sense-making)

Coaches, mentors, parents, teachers, provide opportunity and give feedback – but the performance is up to the learner
Where is the teacher “coaching” a learning process that includes practice and elaboration?

Positive interdependence

Leader: Summarizes the problem, proposes a strategy, coordinates the conversations, keeps everyone on task, and keeps track of available time.

Individual accountability

Recorder: Writes down the answers on behalf of the group, frequently checks with teammates to assure accuracy.

Monitor: Assures that all are participating and comfortable with the group consensus with responses; brings up alternative possibilities.

Roles of group members

Team Work Checkup:

What is the **strongest** aspect of our work as a team?

What is the **weakest** aspect of our work as a team?

What can we **do** to make our team work better for helping all of us learn?

---

**Connect Your Approach to What Learners Value**

- Link active, collaborative learning to students’ educational goals
- Make development of teamwork skills a learning outcome for the course
- Guide student reflection on good teamwork
- Be sure that group exercises foster positive interdependency and individual accountability
Starting the Semester: Making Sure Learners are On Board with Your Redesign

Connect Your Approach to What Learners Value

Gary Smith
Director, Office for Medical Educator Development
Professor, Organization, Information, & Learning Sciences
PI, STEM Gateway (Dept. of Ed. Title V)

University of New Mexico
gsmith@unm.edu

Summary: Shifting from teacher-centered to learner-centered pedagogy is high-risk for faculty. Adding to the common perceived risks of sacrificing course content and being ineffective with new techniques are concerns for student resistance and declining teaching-evaluation scores. Therefore, promoting pedagogical shift is incomplete unless instructors are empowered to assist learners to make the shift, too.

Student resistance to active learning and group work are well known. Resistance is attributed to students (a) not wanting – or knowing how – to take responsibility for their learning, (b) favoring an epistemology whereby knowledge is provided by experts rather than constructed by the learner, (c) not accepting a course structure that violates the expected norm, and (d) experiencing transition stresses comparable to psychological grief.

Most suggestions for confronting student resistance focus on the teacher’s motivation. For example, instructors might explain their vision of the course and why it is being taught this way. Guidance to faculty for implementing group work typically focuses on team building and explaining the requirements for group operation.

This session instead emphasizes classroom-tested strategies that employ a learner-centered approach for obtaining student acceptance of their risks by focusing on (a) what they value for their education, and (b) their prior concrete learning experiences.
Activity Idea #1: The First Day Questions (In Class)

(For more information, see Smith, G.A., 2008, First-day questions for the learner-centered classroom; National Teaching and Learning Forum, 17(5), 1-4)

During the first day of class include a discussion that opens with you asking:

“Thinking of what you want to get out of your college education and this course, which of the following is most important to you?

1. Acquiring factual knowledge
2. Learning how to use knowledge in new situations
3. Developing skills to continue learning after college”

Student voting usually emphasizes items 2 and 3. Therefore, learners typically place a high value on the types of thinking that faculty also have as primary goals for their students. However, this match does not necessarily mean that students understand how to achieve these goals. Next, ask:

“All three goals are clearly important; for instance you can’t use knowledge without first obtaining it. But, let’s think for a moment of how best to accomplish these goals. Learning is not a spectator sport – it takes work; that includes work in the classroom and work that you do outside of the classroom. So, of these three goals, which do you think you can make headway on outside of class by your own reading and studying, and which do you think would be best achieved in class working with your classmates and me?”

Typically, most students respond that they can make progress with factual knowledge acquisition on their own and want assistance with the other two goals. This result leads to a discussion of how to pursue goals 2 and 3. Goals 2 and 3 are not achieved by reading or listening to a lecturer – students must actively do things in order to learn. Students learn best when they take an active role:

- When they discuss what they are reading
- When they practice what they are learning
- When they apply practices and ideas.

This expectation of active learning causes students to realize that in order to reach their just-stated goal they have must prepare for in-class learning by making first contact with content on their own (e.g., reading, online lectures and/or exercises). Then, students and instructors together use that content during class in active-learning activities (e.g., collaborative or cooperative learning, discussion, etc.) that, when effective, challenge students to reach for always higher but reachable bars of accomplishment. This discussion can also lead to the importance of feedback for learning and the need for frequent formative assessment. The focus is on learning, not simply performing for a grade.

Students may be inexperienced with active learning or the expectations placed upon them for their learning. This activity is designed for motivating students to value the active-learning strategies used in a course and the partnership responsibilities of instructor and student. Without this introductory dialogue, the expectation of coming to class prepared, the expectation to work with peers in class, and the expectation to complete frequent writing assignments and other formative assessments of learning can seem foreign to students. It may seem to them like too much work compared to listening to lectures and regurgitating facts on exams.

However, once students recognize the link between their goals and the implemented learning methods they have a new appreciation for why you and they do the things that happen in the course, and they come to value these methods so long as the methods are used effectively and students can measure their own learning.
Activity #2: Connecting Course Objectives to What Employers (and Students?) Want (In Class)

Faculty commonly feel that students only seek a job after graduation and view the college curriculum as a minefield to be navigated using a path of least resistance; students don’t want to learn, they want a degree. A biology professor at the University of Michigan shares this comment written by one of his students: “Education is the only business where the consumer is satisfied with less product.”

You may find this view too cynical but it is supported by research into college student motivation. A Carnegie Council on Policy Studies in Higher Education survey shows that more than half of undergraduates believe the chief benefit of college is higher earning power, and more than one third admit they would drop out if they did not think that attending college was helping their job chances.

This activity, recommended for the first day of class, encourages students to link the common expectations of employers who hire college graduates with the opportunities for knowledge and skill development, including teamwork and leadership, in their classes.

Initiate the discussion with this question: “How important is it, to you, to develop skills in your coursework that will help you land a job when you graduate?” Usually, students respond that this should be an important goal.

Next ask, “Can you pick which items in the following list are the top-5 most desired characteristics among recent college graduates as reported by hiring companies?”

1. Creativity
2. Computer skills
3. GPA, cutoff above 3.0
4. Leadership skills
5. Problem-solving skills
6. Teamwork skills
7. Verbal communication skills
8. Written communication skills
9. Analytical/Quantitative skills

Students form discussion groups and each group writes its consensus five-item list on the board. Then, follow with the actual employer survey results (shown below). This activity is particularly effective for getting student buy in for courses requiring significant writing and team work.

1. Leadership (80.6%)
2. Problem-solving skills (75.3%)
3. Written communication skills (74.7%)
4. Ability to work in a team (74.2%)
5. Analytical/quantitative skills (73.0%)

(Cutoff at a GPA value above 3.0 was noted by only 20% of respondents).

(National Association of Colleges and Employers, 2012)

The importance of teamwork and leadership (which is fostered through teamwork) serves as a motivation for participating in courses where learning and working together in teams is a critical part of course design and included in the learning objectives.

(Inspired by a Calif. St. Univ Learning Across the Curriculum module: “Helping Ourselves by Helping Others – Working in Groups”)

1 D.J. Klionsky, 2004, Talking Biology: Learning Outside the Book—and the Lecture
Cell Biology Education, v. 3, p. 204–211
Activity #3 Connecting Expertise to Learning Approach (In Class)

This exercise is intended to connect students with how they learn outside of their academic experiences with how they should learn in college; learning is learning regardless of context.

Begin with this reflection prompt:

“Think of something that you consider yourself to be very good at, other than being a student of a school subject. For instance, examples might be athletic accomplishment, artistic ability, musical instrument talent, another creative ability (such as writing poetry or fiction). Now – think about the process that you went through to develop the expertise that you have acquired.”

After giving students a few minutes to come up with their personal lists, ask them to talk at their tables to derive common, generalized lists of “Processes for Developing Expertise”. Have them write these short lists on the board. Then – guide students to see the most common listed items.

Usually, these lists include items such as:

- Hard work
- Lots of practice
- Getting instruction and feedback from parents, coaches, mentors, teachers, etc.
- Learning from mistakes; trying it and getting pointers for improvement from teachers, coaches, etc.

Then lead a discussion along these lines:

“Your brain treats all sorts of learning the same way. In fact, learning is a biological process involving the linking of neurons with synapses that permit you to retrieve and utilize information over and over again. When you learn something, your brain is physically changed. From a neuroscience standpoint, learning math or chemistry isn’t really different from learning to create a sculpture or throw an accurate football pass. So, what implications for your learning in college can you derive from the lists you’ve written on the boards?”

Expected ideas include:

- Hard, disciplined work
- Practice – by doing lots of sample problems and keeping up with homework
- Getting feedback from teachers and seeking assistance when progress seems unsatisfactory
- Being willing to accept mistakes as part of the learning process

Activity #4: Reflecting on How to Make Group Work, Work (Online)

This assignment is delivered as a reflective-writing prompt that students complete online at the end of the first or second week of class. The objective is for students to reflect on their perceptions of disadvantages of group work and design potential solutions to their concerns.

Prompt:

Working in teams is a significant part of the learning environment for [class name]. You will be placed in an assigned group for the semester. You will complete in-class assignments and ongoing projects as a team. Nearly everyone has some concerns or reservations about working as a part of a group. Pick one aspect of working in small groups that is a concern for you. Explain why you have this concern.

Then, skim through the three provided links and seek information that is relevant to your concern. Write a few sentences that explains how you can help alleviate your concern during the semester.

Coping with Hitchhikers and Couch Potatoes on Teams

Fact and Fiction: Common Fears about Group Work
Writing@CSU, Colorado State University
http://writing.colostate.edu/guides/page.cfm?pageid=849

Activity #5: Establish the Roles and Responsibilities for Teamwork (In Class)

Important: Rotate roles so that responsibilities change with each class period.

<table>
<thead>
<tr>
<th>Positive interdependence</th>
<th>Individual accountability</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Roles of group members</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Leader:** Summarizes the problem, proposes a strategy, coordinates the conversations to assure even participation by all, keeps everyone on task, and keeps track of available time.

**Recorder:** Writes down the answers on behalf of the group, frequently checks with teammates to assure accuracy of what is written.

**Monitor:** Assures that all team members are participating and are comfortable with the group consensus with responses; brings up alternative possibilities. All team members respect the role of the monitor to ask dominating members to provide opportunities for other voices, to ask quiet members to share their insights, and to make sure that everyone understands the recorded answers.

Note: In four person teams, 2 people share the Monitor role. If only two people are present, the Recorder also serves as Monitor.

August 2014; rev 8/15
Activity #6: Team Work Check Up (In Class)

This exercise is intended as a quick writing response by each team. It should ideally be done several times a semester by having students respond to these prompts (shortened if necessary for time) as a team at the end of class. The objective is to generate conversations within groups about what is or is not working, and potentially activates previous reflection (Activity #3) and experience (Activity #4) to seek solutions and make suggestions.

What is the strongest aspect of our work as a team?
What is the weakest aspect of our work as a team?
What can we do to make our team work better for helping all of us learn?

Framing the Interactive Engagement Classroom
http://www.colorado.edu/sei/fac-resources/framing.html

Instructor-written materials from a variety of disciplines for generating student buy-in to innovative classroom techniques.
The Science Education Initiative at the University of Colorado Boulder
Do you know that some studies conclude that most instructor-designed multiple-choice tests are flawed in ways that diminish student achievement regardless of their knowledge?

Do you know the pitfalls to avoid when constructing a test?

Do you want to improve formative and summative assessment of higher-order learning with your multiple-choice questions?
Designing Multiple-Choice Assessments

Start with asking the question ...

... What is the test supposed to assess?

**Blueprint**

- What content will be assessed, and with what weighting?
- What course learning objectives are being assessed?
- What types of cognition and knowledge are being assessed?

25 total questions
- Topic X: 5 questions
- Topic Y: 10 questions
- Topic Z: 10 questions

Learning objectives 1, 3, and 4 need to be included
Compared student performance on “flawed” and “standard” items on four 1st and 2nd year medical school exams.

Questions with flawed item formats were 0 to 15 percentage points “more difficult” than standard, non-flawed item formats.

Flawed test questions contributed from 0 to 41% (median of 20%) of the variance in test scores.

“One can conclude that some students – perhaps as high as 10-15% of students tested – were incorrectly classified as failed when they should have been classified as passed, due solely to flawed item formats and the ineptitude of test item writers.”
A physical therapist is evaluating a patient with pain that radiates throughout his lower extremities. The patient has significant foot drop while ambulating and complains of numbness and tingling extending from the great toe up to the knee along the anterior leg. What is the MOST likely pathology underlying these symptoms?

- a) Sciatic nerve entrapment
- b) Deep peroneal nerve inflammation
- c) Tibial nerve entrapment
- d) L5 nerve root entrapment

Options: [ ]

Distractors: [ ]

Key: [ ]

• Does the item assess important content?
• Does the item assess necessary cognitive processing and knowledge?
• Does the item contain only relevant information?

Cognitive load:
• Examinees shouldn’t have to think harder than the content requires
• Examinees should be focused on the content, not the testing process
Content concerns
1. Every item should reflect specific content and a single specific mental behavior, as called for in test specifications (two-way grid, test blueprint).
2. Base each item on important content to learn; avoid trivial content.
3. Use novel material to test higher level learning. Paraphrase textbook language or language used during instruction when used in a test item to avoid testing for simply recall.
4. Keep the content of each item independent from content of other items on the test.
5. Avoid over specific and over general content when writing MC items.
6. Avoid opinion-based items.
7. Avoid trick items.
8. Keep vocabulary simple for the group of students being tested.

Formatting concerns
9. Use the question, completion, and best answer versions of the conventional MC, the alternate choice, true-false (TF), multiple true-false (MTF), matching, and the context-dependent item and item set formats, but AVOID the complex MC (Type K) format.
10. Format the item vertically instead of horizontally.

Style concerns
11. Edit and proof items.
12. Use correct grammar, punctuation, capitalization, and spelling.
13. Minimize the amount of reading in each item.

Writing the stem
14. Ensure that the directions in the stem are very clear.
15. Include the central idea in the stem instead of the choices.
16. Avoid window dressing (excessive verbiage).
17. Word the stem positively, avoid negatives such as NOT or EXCEPT. If negative words are used, use the word cautiously and always ensure that the word appears capitalized and boldface.

Writing the choices
18. Develop as many effective choices as you can, but research suggests three is adequate.
19. Make sure that only one of these choices is the right answer.
20. Vary the location of the right answer according to the number of choices.
21. Place choices in logical or numerical order.
22. Keep choices independent; choices should not be overlapping.
23. Keep choices homogeneous in content and grammatical structure.
24. Keep the length of choices about equal.
25. None-of-the-above should be used carefully.
26. Avoid All-of-the-above.
27. Phrase choices positively; avoid negatives such as NOT.
28. Avoid giving clues to the right answer, such as
   a. Specific determiners including always, never, completely, and absolutely.
   b. Clang associations, choices identical to or resembling words in the stem.
   c. Grammatical inconsistencies that cue the test-taker to the correct choice.
   d. Conspicuous correct choice.
   e. Pairs or triplets of options that clue the test-taker to the correct choice.
   f. Blatantly absurd, ridiculous options.
29. Make all distractors plausible.
30. Use typical errors of students to write your distractors.
31. Use humor if it is compatible with the teacher and the learning environment.
### Bloom’s Taxonomy of the Cognitive Domain

<table>

Determine the cognitive level in Bloom’s taxonomy of each of the following questions

1. What is the first step in constructing an achievement test?
   a. Decide on test length.
   b. Identify the intended learning outcomes.
   c. Prepare a table of specifications.
   d. Select the stem types to use.

   Bloom level: ________________________________

2. Which one of the following learning outcomes is properly stated in terms of student performance?
   a. Develops an appreciation of the importance of testing.
   b. Explains the purpose of test specifications.
   c. Learns how to write good test items.
   d. Realizes the importance of validity.

   Bloom level: ________________________________

3. Directions: read the following test question and then indicate the best change to make to improve the question.

   Which one of the following types of learning outcomes is most difficult to evaluate objectively?
   a. A concept.
   b. An application.
   c. An appreciation.
   d. None of the above.

   The best change to make in the previous question would be to:
   a. Change the stem to incomplete-statement form.
   b. Use numbers instead of letters for each alternative.
   c. Remove the indefinite articles “a” and “an” from the alternatives.
   d. Replace “none of the above” with “an interpretation.”

   Bloom level: ________________________________

4. Directions: Read the following comments a teacher made about testing. Then answer the questions that follow by selecting the letter of the best answer.

   “Students go to school to learn, not to take tests. In addition, tests cannot be used to indicate a student’s absolute level of learning. All tests can do is rank students in order of achievement, and this relative ranking is influenced by guessing, bluffing, and the subjective opinions of the teacher doing the scoring. The teacher-learning process would benefit if we did away with tests and depended on student self-evaluation.”

   Which one of the following unstated assumptions is this teacher making?
   a. Students go to school to learn.
   b. Teachers use essay tests primarily.
   c. Tests make no contribution to learning.
   d. Tests do not indicate a student’s absolute level of learning.

   Which one of the following types of test is this teacher primarily talking about?
   a. Diagnostic test.
   b. Formative test.
   c. Pretest.
   d. Summative test.

   Bloom level: ________________________________

Which question in each pair is the best question? Why?

1A. Which of the following is a category in the taxonomy of the cognitive domain?
   a) Reasoning ability
   b) Critical thinking
   c) Rote learning
   d) All of the above
   e) None of the above

Reason(s):

1B. What is the most complex level in the taxonomy of the cognitive domain?
   a) Remember
   b) Create
   c) Evaluate
   d) Analyze
   e) Understand

Reason(s):

2A. A physical therapist is working with a patient who is aware that he is terminally ill. Which of the following courses of action is most appropriate when the patient wants to talk about his prognosis?
   a) Patient is discouraged from talking about death and dying
   b) Pastoral counseling
   c) The therapist’s experiences with terminally ill patients
   d) Encouraging the patient’s expression of feelings

Reason(s):

2B. A patient who is terminally ill and knows the diagnosis wants to talk with the physical therapist about the diagnosis. Which of the following courses of action is MOST appropriate for the therapist?
   a) Discourage discussion of death and dying
   b) Refer the patient for pastoral counseling
   c) Relate the therapist’s experience with other patients
   d) Encourage the patient’s expression of feelings

Reason(s):

3A. The mean of a distribution of test scores is the:
   a) Most frequently occurring score
   b) Arithmetic average
   c) 50th percentile
   d) Measure of score range

Reason(s):

3B. A university developed an aptitude test to use for admission to its Honors Program. The test was administered to a group of seven applicants who obtained the following scores: 70, 72, 72, 80, 89, 94, 98. The mean score on the aptitude test is:
   a) 72
   b) 80
   c) 82
   d) 90

Reason(s):
Which question in each pair is the best question? Why?

4A. Ribosomes are important for:
   a) the nucleus
   b) DNA
   c) Cellulose
   d) Protein synthesis

   Reason(s):

4B. Suppose you thoroughly and adequately examined a particular type of cell, using the transmission electronic microscope, and discovered that it completely lacked ribosomes. You would then conclude that this cell also lacked:
   a) A nucleus
   b) DNA
   c) Cellulose
   d) Protein synthesis

   Reason(s):

5A. In what year did World War I begin?
   a) 1714
   b) 1814
   c) 1914
   d) 1614

   Reason(s):

5B. In what year did World War I begin?
   a) 1914
   b) 1915
   c) 1916
   d) 1917

   Reason(s):

6A. Countries that made up the “Central Powers” in World War I included:
   1. Germany
   2. Austria-Hungary
   3. United States
   4. Russia

   a) 1 and 2
   b) 1, 2, and 3
   c) 1, 2, and 4
   d) 2 and 3

   Reason(s):

6B. Which countries below were members of the “Central Powers” in World War I?

   1. Germany
      a) member of Central Powers  b) not a member
   2. Austria-Hungary
      a) member of Central Powers  b) not a member
   3. United States
      a) member of Central Powers  b) not a member
   4. Russia
      a) member of Central Powers  b) not a member

   Reason(s):
Use the space below to evaluate the example questions you brought. For each question answer:

1. Can you match this question to a course-level or session-level objective?

2. Does the question violate any item writing guidelines? If so, how can it be adjusted? (See pages 3-4 for the Item Writing Guidelines)

3. What level of Bloom's taxonomy does the question plot on? Is there a way to alter the question so that it plots as a higher order question? (See page 5 for the Bloom's table)
Examples of converting "high-level" short-answer questions into multiple-choice questions.

**Example 1**

<table>
<thead>
<tr>
<th>Structure of MCQ</th>
<th>Standard MCQ</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cognitive Level</td>
<td>LOC/HOC; Apply</td>
</tr>
<tr>
<td>Discipline</td>
<td>General Chemistry (McKinstry, L., personal communication)</td>
</tr>
<tr>
<td>Free-response</td>
<td>Calculate the molar concentration of a 50.0 mL aqueous solution containing 25.0 g of glucose (C₆H₁₂O₆).</td>
</tr>
<tr>
<td>MCQ (answer in bold)</td>
<td>What is the molar concentration of a 50.0 mL aqueous solution containing 25.0 g of glucose (C₆H₁₂O₆)?</td>
</tr>
<tr>
<td></td>
<td>a. 0.500 M</td>
</tr>
<tr>
<td></td>
<td>b. 2.78 M</td>
</tr>
<tr>
<td></td>
<td>c. 5.00 \times 10^{2} M</td>
</tr>
<tr>
<td></td>
<td>d. 2.78 \times 10^{1} M</td>
</tr>
<tr>
<td></td>
<td>e. 0.360 M</td>
</tr>
<tr>
<td>Explanation</td>
<td>This HOC question requires application of content about molar mass, moles, and molarity (Molarity = mol/L). Students must first determine the molar mass of glucose using the periodic table. They then convert the grams glucose into moles glucose using the molar mass, and convert milliliters into liters. Taking significant figures into consideration, they then use these values in the equation to solve for molarity. The student then selects the answer from the list of options. For these reasons, this question is at the application level of Bloom’s Taxonomy. The distractors for this question are plausible because if a student uses the number of grams given instead of converting it to moles, their answer would be close to option c. If they don’t convert to liters and divide by grams, their answer is option a. Option e is a value close to one obtained if the dimensional analysis (unit conversion) is done incorrectly. Option d looks superficially similar to the correct answer. Although these are all plausible distractors, this question could be reduced to three options, a, b, and e, because those distractors are the most plausible given common mistakes with these types of calculations.</td>

MCQ (answer in bold)

1. Using the principles of cross-cutting and superposition, place the sequence of depositional or structural events depicted in the figure from oldest to youngest.

   ![Diagram of strata and layers]

   a. 2, 1, 7, 5, 4, 6, 3
   b. 7, 2, 1, 6, 3, 5, 4
   c. 2, 7, 1, 5, 4, 3, 6

2. If transitional fossils were found in layers 1, 2, and 4, which of the following is true of the fossils found in layer 1?
   a. fossils in layer 1 represent organisms from which the species in layer 4 evolved
   b. fossils in layer 1 represent organisms from which the species in layer 2 evolved
   c. fossils in layer 1 are not related to the species in layers 2 and 4

Explanation

This multiple-choice question requires application of content, analysis of the diagram, and inference, and is at the analysis level of Bloom’s Taxonomy. In the first part, students must apply the principles of superposition and cross-cutting to determine the relative dates of the strata. Strata deposited on top of other strata are younger; strata that cross-cut other strata are also younger. This question has two strong distractors because strata 2 and 7 are the oldest layers; it may appear that layer 7 cross-cuts layer 2, so some students might select this option. The students need only to compare three strata (1, 2, and 7) to make a selection.

Although the second question also requires students to determine the relative dates of strata, the three strata selected are depositional and easier to date. Thus, the task is not as difficult as in question 1. However, question 2 requires students to understand that transitional fossils show common ancestry and to infer the ancestral relationships by comparing the strata in which they are found. This question is at the analysis level of Bloom’s Taxonomy.
Example 3

Structure of MCQ  True/False, Two-Tier Question

Cognitive Level  HOC; Apply or Analyze

Discipline  General Biology

Free-response  Explain how 2,4-dinitrophenol, an ionophore that transports protons across the inner mitochondrial membrane to the matrix, affects ATP synthesis.

MCQ (answer in bold)  
1. The drug 2,4-dinitrophenol is an ionophore that transports protons across the inner mitochondrial membrane to the matrix. This drug would increase ATP synthesis.
   True or False?

2. Your selection is most closely associated with which of the following explanations?
   a. the drug directly increases the electrochemical gradient
   b. the drug directly decreases the electrochemical gradient
   c. the drug directly impacts ATP synthase and the reaction that makes ATP

Explanation  This HOC question requires application of content and inference of how 2,4-dinitrophenol impacts cellular respiration. To correctly answer the true/false question, students must know that the electron transport chain creates an electrochemical gradient, or proton force, by pumping protons from the matrix to the inner membrane space of the mitochondria. This gradient is then used to drive the reaction catalyzed by ATP synthase that makes ATP. Asking this question as a two-tiered question helps reduce the error associated with guessing the answer to the first question. Distractor “a” in question 2 is based on whether the student knows that the proton force is an electrochemical gradient and also the direction in which protons are pumped—from the matrix to the inner membrane space. Distractor “c” is based on a common misconception that the electron transport chain is directly connected to the production of ATP by ATP synthase. This drug would indirectly impact ATP synthase in catalyzing the reaction that makes ATP. This question is at the analysis level of Bloom’s Taxonomy.
Item Analysis – What Teachers Learn from Administering a Test

1. Where would freeze-thaw weathering most likely occur?
   a. At the top of the Sandia Mountains
   b. In a rainforest
   c. Along a coastline
   d. Along the Rio Grande in Albuquerque

2. A feldspar is plucked from sandstone, analyzed at an isotope-dating lab, and determined to be 200 million year old. What does this tell you about the age of the sandstone?
   a. The sandstone is older than 200 million years old
   b. The sandstone is 200 million years old
   c. The sandstone is less than 200 million years old.
   d. Nothing. The sandstone could be any age.

3. Which of the following factors does not determine the mineral composition and texture of a metamorphic rock?
   a. Environment of deposition
   b. Original rock composition
   c. Temperature and pressure
   d. Abundance and composition of fluid

4. Which property of seismic waves has been most important to allow seismologists to identify the boundaries of the inner core/outer core boundary and the outer core/mantle boundary?
   a. Wave reflection
   b. Wave amplitude
   c. Wave velocity
   d. Wave refraction

Learning From Each Other-
A Different Way to Think about Classroom Observation

- Have you ever considered visiting a colleague’s class to learn about teaching from observing how she or he teaches?
- How can your redesign effort be improved by learning from each other’s classroom practices?
- How can you maximize your learning during a classroom observation?
Learning from One Another Through Observations

A list of questions to contemplate when making classroom observations for the purpose of learning as an observer, rather than for evaluating the teacher. This draft was prepared collaboratively by members of the STEM Gateway course redesign teams on October 21, 2013.

In-Class Observation

Things to look for:

1. *Introducing the topic*

   a. How are objectives addressed?

   b. How is relevance of the class session addressed?

   c. How are links to other course topics addressed?

   d. How much time is allotted to introducing the topic?
2. *Implementing direct instruction and active learning*

   a. How is instructor transmission of knowledge to students occurring?

   b. How is instructor-to-student interaction occurring?

   c. How is student-to-student interaction occurring?

3. What are the students doing?
### Reformed Teaching Observation Protocol (RTOP) Scoring Rubric

(From Classroom Observation Project, Science Education Resource Center, http://serc.carleton.edu/NAGTWorkshops/certop/index.html)

<table>
<thead>
<tr>
<th>1) Instructional strategies and activities respected students’ prior knowledge and the preconceptions inherent therein (what’s happened before this class)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Never occurred</td>
</tr>
<tr>
<td>Lesson is designed to remind students of what they already know and to make use of students’ everyday knowledge</td>
</tr>
<tr>
<td>Lesson is designed to use student input to assess their prior knowledge but not to adjust.</td>
</tr>
<tr>
<td>Lesson is designed to activate student prior knowledge, assess and adjust content as needed, and makes use of students’ input on their prior knowledge</td>
</tr>
<tr>
<td>Lesson is designed to activate student prior knowledge, assess and adjust content as needed, and makes use of students’ input throughout the class</td>
</tr>
</tbody>
</table>

**Comments:**

A cornerstone of reformed teaching is taking into consideration the prior knowledge that students bring with them. The term “respected” is pivotal in this item. It suggests an attitude of curiosity on the teacher’s part, an active solicitation of student ideas, and an understanding that much of what a student brings to the mathematics or science classroom is strongly shaped and conditioned by their everyday experiences.

Prior knowledge includes both instruction from prior classes and knowledge from everyday experiences. Strategies for referencing prior knowledge include everyday analogies, references to learning from other courses, and references to previous classes in this course. A strong class will activate prior knowledge before initiating relevant instruction, will adjust to prior knowledge levels, and will activate prior knowledge in specific contexts throughout the lesson.
2) The lesson was designed to engage students as members of a learning community

<table>
<thead>
<tr>
<th>No evidence</th>
<th>Lesson has limited opportunities to engage students. (e.g., some clickers, rhetorical questions with shout out opportunities, clarification questions)</th>
<th>Lesson is designed for continual interaction between teacher and students</th>
<th>Lesson is designed to include both extensive teacher-student and student-student interactions</th>
<th>Lesson was designed for students to negotiate meaning of content primarily through student-student interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Comments: Much knowledge is socially constructed. The setting within which this occurs has been called a “learning community.” The use of the term community in the phrase “the scientific community” (a “self-governing” body) is similar to the way it is intended in this item. Students participate actively, their participation is integral to the actions of the community, and knowledge is negotiated within the community. It is important to remember that a group of learners does not necessarily constitute a “learning community.”
3) In this lesson, student exploration preceded formal presentation (students asked to think or do something relevant to new content *prior to* introduction of concept or can come later and be with respect to details)

<table>
<thead>
<tr>
<th>Exploration preceded explanation of new content (instructor provides answers, tells students how to work through a problem, gives the facts or solutions to a problem, or leads students on a step-by-step solution)</th>
<th>Exploration precedes new content that is limited in quality or quantity (e.g., students don’t interact with each other, teacher intercepts some of their ability to draw conclusions, not enough time is provided to make any meaningful conclusions)</th>
<th>Exploration precedes new content prior to the larger conceptual framework has been presented, but may lack student opportunities to explore without teacher intervention or enough time to make clear connections to the larger framework</th>
<th>Exploration precedes new content that encourages students to work together, to ask probing questions that re-direct their thinking, and teacher acts as a consultant for students, but students may not have a clear reason for why exploration occurred</th>
</tr>
</thead>
<tbody>
<tr>
<td>No exploration preceded new content</td>
<td>Limited opportunities</td>
<td>Exploration precedes new content prior to the larger conceptual framework has been presented, but may lack student opportunities to explore without teacher intervention or enough time to make clear connections to the larger framework</td>
<td>Exploration precedes new content that encourages students to work together, to ask probing questions that re-direct their thinking, and teacher acts as a consultant for students, but students may not have a clear reason for why exploration occurred</td>
</tr>
<tr>
<td>No exploration preceded new content</td>
<td>Limited opportunities</td>
<td>Exploration precedes new content prior to the larger conceptual framework has been presented, but may lack student opportunities to explore without teacher intervention or enough time to make clear connections to the larger framework</td>
<td>Exploration precedes new content that encourages students to work together, to ask probing questions that re-direct their thinking, and teacher acts as a consultant for students, but students may not have a clear reason for why exploration occurred</td>
</tr>
<tr>
<td>Exploration precedes new content that is limited in quality or quantity (e.g., students don’t interact with each other, teacher intercepts some of their ability to draw conclusions, not enough time is provided to make any meaningful conclusions)</td>
<td>Opportunity provided with limited connection</td>
<td>Opportunities but lacking full follow-through</td>
<td>Longer quality opportunities</td>
</tr>
</tbody>
</table>

*Comments:* Reformed teaching allows students to build complex abstract knowledge from simpler, more concrete experience. This suggests that any formal presentation of content should be preceded by student exploration. This does not imply the converse...that all exploration should be followed by a formal presentation. Students draw conclusions prior to proceeding, teacher creates a need-to-know setting.
4) This lesson encouraged students to seek and value alternative modes of investigation or of problem solving (questions have more than one right possible answer)

<table>
<thead>
<tr>
<th>No alternative modes explored</th>
<th>Lesson designed for instructor to introduce open-ended questions with multiple correct answers or describe multiple modes of investigation</th>
<th>Lesson designed for students to make use of or explore multiple modes of investigation</th>
<th>Lesson designed for students to generate and explore open-ended questions or to generate multiple modes for investigating a question</th>
<th>The central method of learning in the class is student generation of and exploration of an open-ended problem using multiple modes of investigation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Instructor Tell/Introduce 1</td>
<td>Students Use 2</td>
<td>Students Generate 3</td>
<td>Central focus of class 4</td>
<td></td>
</tr>
</tbody>
</table>

**Comments:**
Divergent thinking is an important part of mathematical and scientific reasoning. A lesson that meets this criterion would not insist on only one method of experimentation or one approach to solving a problem. A teacher who valued alternative modes of thinking would respect and actively solicit a variety of approaches, and understand that there may be more than one answer to a question.

Modes of investigation refer to different approaches or lines of evidence for address a problem. In a lower scoring class, these are presented to the students by the instructor. In a high scoring class students are actively involved in generating approaches.
5) The focus and direction of the lesson was often determined by ideas originating with students (is there a clear plan to incorporate student ideas?)

<table>
<thead>
<tr>
<th>Lesson is entirely instructor directed</th>
<th>Lesson plan accommodates instructor pausing for student questions and ideas</th>
<th>Lesson plan call for student generated ideas</th>
<th>Lesson plan designed adjustments based on student input.</th>
<th>Lesson plan is entirely student directed, with content guided by instructor, but has allowances for different ideas, and questions</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

*Comments*: If students are members of a true learning community, and if divergence of thinking is valued, then the direction that a lesson takes can not always be predicted in advance. Thus, planning and executing a lesson may include contingencies for building upon the unexpected. A lesson that met this criterion might not end up where it appeared to be heading at the beginning.
### Content: Propositional Knowledge (What the Teacher knows, and how well they are able to organize and present material in a learner-oriented setting)

<table>
<thead>
<tr>
<th>6) The lesson involved fundamental concepts of the subject (Is content concept-oriented?)</th>
</tr>
</thead>
<tbody>
<tr>
<td>No clear focus, just a series of random facts 0</td>
</tr>
<tr>
<td>Concept taught, but not necessarily within a conceptual framework. Topic is bogged down in term definitions 2</td>
</tr>
<tr>
<td>Instructor ties concepts to conceptual framework without any tangential material that potentially confounds 4</td>
</tr>
</tbody>
</table>

**Comments:**
The emphasis on “fundamental” concepts indicates that there were some significant scientific or mathematical ideas at the heart of the lesson. For example, a lesson on the multiplication algorithm can be anchored in the distributive property. A lesson on energy could focus on the distinction between heat and temperature.

---

### 7) The lesson promoted strongly coherent conceptual understanding (Presented in a logical and clear fashion—how it’s presented; does the lesson make sense, general flow)

| Not presented in any logical manner, lacks clarity and no connections between material and no concepts 0 | Lesson is disjointed and not consistently focused on the concepts 1 | Lesson is clear and/or logical but relation of content to concepts is very inconsistent (or vice versa) 2 | Lesson is predominantly presented in a clear and logical fashion, but relation of content to concepts is not always obvious 3 | Lesson is presented in a clear & logical manner, relation of content to concepts is clear throughout and it flows from beginning to end. 4 |

**Comments:** The word “coherent” is used to emphasize the strong inter-relatedness of mathematical and/or scientific thinking. Concepts do not stand on their own two feet. They are increasingly more meaningful as they become integrally related to and constitutive of other concepts.
8) The teacher had a solid grasp of the subject matter content inherent in the lesson

<table>
<thead>
<tr>
<th>Teacher had no clear understanding of content</th>
<th>Teacher has some of the fundamentals, but lesson is still wrought with errors</th>
<th>Mistakes are abundant or non-trivial, may promote misconceptions but many fundamentals are sound</th>
<th>May have minor mistakes, overall accurate delivery</th>
<th>No mistakes, all information presented is accurate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

**Comments:**
This indicates that a teacher could sense the potential significance of ideas as they occurred in the lesson, even when articulated vaguely by students. A solid grasp would be indicated by an eagerness to pursue student’s thoughts even if seemingly unrelated at the moment. The grade-level at which the lesson was directed should be taken into consideration when evaluating this item.

9 Elements of abstraction (i.e., symbolic representations, theory building) were encouraged when it was important to do so (is the instructor using abstractions (representations of phenomena that cannot be observed directly) in a way that scaffolds student development of conceptual understanding)

<table>
<thead>
<tr>
<th>Teacher uses only text/facts with no opportunities for students to develop conceptual understanding</th>
<th>Teacher uses few elements of abstraction (e.g., diagrams, equations) and not in a logical sequence to develop student conceptual understanding</th>
<th>Teacher uses few elements of abstraction (e.g., diagrams, equations) in a logical sequence to develop student conceptual understanding</th>
<th>Teacher uses multiple elements of abstraction (e.g., diagrams, equations) in a logical sequence to develop student conceptual understanding</th>
<th>Teacher uses multiple elements of abstraction (e.g., diagrams, equations) in a logical sequence to develop and assess student conceptual understanding</th>
</tr>
</thead>
<tbody>
<tr>
<td>Not present 0</td>
<td>Few 1</td>
<td>Few in Sequence 2</td>
<td>Many in Sequence 3</td>
<td>Assess 4</td>
</tr>
</tbody>
</table>

**Comments:**
Conceptual understanding can be facilitated when relationships or patterns are represented in abstract or symbolic ways. Not moving toward abstraction can leave students overwhelmed with trees when a forest might help them locate themselves.
10) Connections with other content disciplines and/or real world phenomena were explored and valued

<table>
<thead>
<tr>
<th>No connections drawn to real world/other disciplines</th>
<th>Some connection to real world/other disciplines made in passing, but not central for content comprehension</th>
<th>Teacher makes a deliberate effort to connect to real world/other disciplines, but teacher does all the talking</th>
<th>Students participate in making connections to other disciplines/real world phenomena</th>
<th>Students participate in making multiple connections to other disciplines and real world phenomena in ways that extend their understanding of central concepts</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Comments:
Connecting mathematical and scientific content across the disciplines and with real world applications tends to **generalize it and make it more coherent**. A physics lesson on electricity might connect with the role of electricity in biological systems, or with the wiring systems of a house. A mathematics lesson on proportionality might connect with the nature of light, and refer to the relationship between the height of an object and the length of its shadow.

The goal is to integrate the new knowledge with other learning particularly from other disciplines and to show their application in real world applications/phenomena. The goal is to build ties between students existing knowledge, the new knowledge and real world application. Time invested in assisting students in building a single set of strong ties has more value than developing a large number of weak ties.
### Content: Procedural Knowledge (What students did)

11) Students used a variety of means (models, drawings, graphs, symbols, concrete materials, manipulatives, etc.) to represent phenomena (variety of means, could also include written interpretation)

<table>
<thead>
<tr>
<th>Students are not asked to do anything</th>
<th>Students use only one means of representing or interpreting phenomena</th>
<th>Students use at least 2 means of representing or interpreting phenomena</th>
<th>Students use at least 2 means of representing and interpreting phenomena</th>
<th>Students use multiple means of representing and interpreting phenomena</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Single Use 1</td>
<td>Multiple Means 2</td>
<td>Representing and Interpreting 3</td>
<td>Multiple Means, Multiple Uses 4</td>
</tr>
</tbody>
</table>

**Comments:**
Multiple forms of representation allow students to use a variety of mental processes to articulate their ideas, analyze information and to critique their ideas. A “variety” implies that at least two different means were used. Variety also occurs within a given means. For example, several different kinds of graphs could be used, not just one kind.

Students that are *asked* to interpret a graph, or map, or diagram does count as interpreting phenomena.
12) Students made predictions, estimations, and/or hypotheses (PEH) and devised means for testing them-

| No opportunities for students to make PEHs 0 | Teacher may ask class to make PEHs as a whole, only a few students are involved in response, no devised means for testing | Poorly executed 1 | Teacher may ask students to make PEHs, mechanism to involve majority of students in generation but no devised means for testing | Incomplete execution 2 | All students are engaged in generating PEHs and in devising testing to enhance understanding of a central concept. Instructor drives generation of PEH and/or testing | Highly prescribed 3 | All students are engaged in generating PEHs and in devising testing to enhance understanding of a central concept. Students drive generation of PEH and testing | Student driven 4 |

Comments:
This item does not distinguish among predictions, hypotheses and estimations. Another word that might be used in this context is “conjectures”. The idea is that students explicitly state what they think is going to happen before collecting data.

A highly scoring class would require that students have the experience of drawing together data, making a prediction, hypothesis or estimation (PEH), and testing the quality of their PEH in a way that enhances their understanding of the central concepts of the lesson.
13) Students were actively engaged in thought-provoking activity that often involved the critical assessment of procedures (quality)

<table>
<thead>
<tr>
<th>Students are completely passive</th>
<th>Students engage in a single thought-provoking activity, perhaps with prompting for minimal critical assessment of procedure</th>
<th>Students engage in a thought provoking activity combined with a follow on prompting for critical assessment of procedure</th>
<th>Students engage in activities that requires both critical analysis and synthesis of both content and procedures or in multiple examples of level 2 activities</th>
<th>Students engage in activities that requires both critical analysis and consideration of where/how students could proceed with new knowledge</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Teacher driven, few opportunities incomplete</td>
<td>Complete opportunity 2</td>
<td>Multiple opportunities or a single complete deep activity</td>
<td>Student driven, deep, multiple complete opportunities 4</td>
</tr>
</tbody>
</table>

**Comments:**
This item implies that students were not only actively doing things, but that they were also actively thinking about how what they were doing could clarify the next steps in their investigation.

Critical assessment of procedures:
- question assumptions
- explore next steps
- consider why you are using a procedures
- evaluate if what you just did makes sense (road check)
14) Students were reflective about their learning (what do you think, and how do you know?)

<table>
<thead>
<tr>
<th>No reflection</th>
<th>Teacher sets up at least one opportunity for students to reflect on learning.</th>
<th>Teacher sets up some opportunities for students to reflect perhaps with prompts</th>
<th>Teacher sets up multiple opportunities for students to reflect with prompts and assists students in understanding relationship to future learning in some way</th>
<th>Students have pervasive opportunities to reflect with structured prompts that scaffold their ability to leverage learning experiences for future use.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>Absence of scaffolding to leverage learning experiences</td>
<td>Partial implementation Not well scaffolded</td>
<td>Thorough</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
<td>2</td>
<td>Ongoing, students practice increasing metacognition</td>
</tr>
</tbody>
</table>

Comments:
Active reflection is a meta-cognitive activity that facilitates learning. It is sometimes referred to as “thinking about thinking.” Teachers can facilitate reflection by providing time and suggesting strategies for students to evaluate their thoughts throughout a lesson. A review conducted by the teacher may not be reflective if it does not induce students to re-examine or re-assess their thinking.

We want student to reflect on what they have learned, how they have learned, and on the utility of both these things in further learning (either as content or strategy). Ongoing opportunities for reflection will score more highly, as will structured prompts that scaffold students ability to leverage learning experiences for future use.
15) Intellectual rigor, constructive criticism, and the challenging of ideas were valued (negotiating meaning/ debating ideas)

<table>
<thead>
<tr>
<th>Students did not have the opportunity to demonstrate rigor, offer criticisms, or challenge ideas</th>
<th>At least once the students respond (perhaps by shout out”) to teacher’s queries regarding alternate ideas, alternative reasoning, alternative interpretations.</th>
<th>Students participate in a teacher directed discussion of differing points of view and evaluation of ideas</th>
<th>Students participate in a teacher-guided but student driven, debate of ideas. Teacher is integral in drawing conclusion regarding evaluation of ideas</th>
<th>Every student participates in debate of ideas that results in group negotiated conclusion that makes deliberate use of evidence/ arguments to support claims.</th>
</tr>
</thead>
<tbody>
<tr>
<td>No opportunity</td>
<td>Single query/one response</td>
<td>Teacher-facilitated discussion</td>
<td>Teacher-guided group debate/discussion</td>
<td>Negotiated student group debate</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

**Comments:**
At the heart of mathematical and scientific endeavors is rigorous debate. In a lesson, this would be achieved by allowing a variety of ideas to be presented, but insisting that challenge and negotiation also occur. Achieving intellectual rigor by following a narrow, often prescribed path of reasoning, to the exclusion of alternatives, would result in a low score on this item. Accepting a variety of proposals without accompanying evidence and argument would also result in a low score.
### Classroom Culture: Communicative Interactions (Student-Student Interaction)*

<table>
<thead>
<tr>
<th>No student interactions – Students asking questions of the instructor or responding individually to questions posed by the instructor do not constitute interaction</th>
<th>At least one opportunity for student interaction that makes use of a single mode and scale of interaction</th>
<th>Either more than one type of student-student communication, but not at a variety of scales (i.e., pairs, small group, group to group, whole class) or vice versa</th>
<th>Multiple modes and scales are represented in the interactions. They may not be well facilitated or well integrated into the learning experience</th>
<th>Students have multiple opportunities to interact at different scales using multiple modes. Communication is well facilitated.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Single mode 1</td>
<td>Not complete 2</td>
<td>Complete but not well executed 3</td>
<td>Comprehensive integration of student interaction 4</td>
</tr>
</tbody>
</table>

**Comments:**
The intent of this item is to reflect the communicative richness of a lesson that encouraged students to contribute to the discourse and to do so in more than a single mode (making presentations, brainstorming, critiquing, listening, making videos, group work, etc.). Notice the difference between this item and item 11. Item 11 refers to representations. This item refers to active communication.

The goal of the communication is to increase students’ understanding of central concepts or their skill level on central skills. A high scoring class requires both a variety of modes for students interaction (e.g. brainstorming, problem solving, discussing, presenting, group work) And interactions at multiple scales (e.g. student-student, student-class, whole class). In high scoring classes, communication is well facilitated. The amount of time students spend in interaction is scored below in Q18.

*Communicative interactions in a classroom are an important window into the culture of that classroom. Lessons where teachers characteristically speak and students listen are not reformed. It is important that students be heard, and often, and that they communicate with one another, as well as with the teacher. The nature of the communication captures the dynamics of knowledge construction in that community. Recall that communication and community have the same root.*
17) The teacher’s questions triggered divergent modes of thinking (by students)

| No divergent modes of thinking | Students listen to teacher present an example of more than one answer or interpretation, but student thinking limited to individual questions about the material. | Students interact with each other in response to teacher-framed question(s) that has/have more than one answer or interpretation, but the directions ask for just one “right” response. | Students work with each other on one or more instructor posed problem that has more than one solution, and to generate complete solutions. | Students work with each other on open ended problems. Opportunities provided for students to ask divergent questions of each other and encouraged to pursue alternative solutions. |
| No opportunity 0 | Teacher-sourced divergent modes 1 | Student interact/respond to divergent modes 2 | Students actively engaged in divergent mode problems 3 | Student-student driven queries of divergent modes 4 |

Comments:
This item suggests that teacher questions should help to open up conceptual space rather than confining it within predetermined boundaries. In its simplest form, teacher questioning triggers divergent modes of thinking by framing problems for which there may be more than one correct answer or framing phenomena that can have more than one valid interpretation.
18) There was a high proportion of student talk and a significant amount of it occurred between and among students (quantity of interactions)

<table>
<thead>
<tr>
<th>No student-student talk</th>
<th>Students talk to each other at least once (about lesson content)</th>
<th>Student-student talk occurs at least 10% of the time during the course of the class</th>
<th>Student-student talk occurs more than 25% of the time during the course of the class</th>
<th>In any given moment during the lesson, students are more likely to be talking to each other than the teacher (&gt;50% student to student)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Comments: A lesson where a teacher does most of the talking is not reformed. This item reflects the need to increase both the amount of student talk and of talk among students. A “high proportion” means that at any point in time it was as likely that a student would be talking as that the teacher would be. A “significant amount” suggests that critical portions of the lesson were developed through discourse among students.

19) Student questions and comments often determined the focus and direction of classroom discourse (quality of student interactions)

<table>
<thead>
<tr>
<th>No student input</th>
<th>Student conversations are short and limited to “the answer,” no negotiation of meaning</th>
<th>Student conversations are brief but do involve some negotiation of meaning</th>
<th>Student conversations are in depth examinations of a problem</th>
<th>Student conversations are detailed, multi-faceted examinations of recent and previously learned content that is student directed</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Comments: This item implies not only that the flow of the lesson was often influenced or shaped by student contributions, but that once a direction was in place, students were crucial in sustaining and enhancing the momentum.
20) There was a climate of respect for what others had to say

<table>
<thead>
<tr>
<th>No ideas beyond instructor are heard</th>
<th>Student voices are present and respected</th>
<th>Faculty and students volunteer ideas; they respect each others point of view and refer to each others points</th>
<th>A majority of faculty and students volunteer ideas or their ideas are solicited; they respect each others point of view and refer to each others points</th>
<th>Every voice is solicited, heard, respected, and valued. Student talk is critical for success; different points of view are discussed and resolved to enhance learning of central ideas</th>
</tr>
</thead>
<tbody>
<tr>
<td>Or there is a climate of disrespect</td>
<td>Student voices are present and respected</td>
<td>Faculty and students volunteer ideas; they respect each others point of view and refer to each others points</td>
<td>A majority of faculty and students volunteer ideas or their ideas are solicited; they respect each others point of view and refer to each others points</td>
<td>Every voice is solicited, heard, respected, and valued. Student talk is critical for success; different points of view are discussed and resolved to enhance learning of central ideas</td>
</tr>
<tr>
<td>0</td>
<td>Respected 1</td>
<td>Used 2</td>
<td>Sought 3</td>
<td>Critical 4</td>
</tr>
</tbody>
</table>

Comments:
Respecting what others have to say is more than listening politely. Respect also indicates that what others had to say was actually heard and carefully considered. A reformed lesson would encourage and allow every member of the community to present their ideas and express their opinions without fear of censure or ridicule.
### Classroom Culture: Student/Teacher Relationships

#### 21) Active participation of students was encouraged and valued

<table>
<thead>
<tr>
<th>Entirely instructor directed, no student questions</th>
<th>Some student questions, may be opportunities to “shout out” ideas</th>
<th>Some student questions/ input are encouraged, and they appear to shift the direction of the lesson</th>
<th>Many students engaged some of the time in valuable conversations that leads to class discussions that appears to shift the direction</th>
<th>All students are actively engaged in meaningful conversation that guides the direction of the lesson from beginning to the end.</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

**Comments:**
This implies more than just a classroom full of active students. It also connotes their having a voice in how that activity is to occur. Simply following directions in an active manner does not meet the intent of this item. Active participation implies agenda-setting as well as “minds-on” and “hands-on”.

---

#### 22) Students were encouraged to generate conjectures, (or) alternative solutions, and/or different ways of interpreting evidence

| Instructor may present interpretations, conjectures, etc., but asks students to do nothing | At least one time, students were asked to consider an alternate solution, make a conjecture, or interpret evidence in more than one way. | Teacher-student interactions lead students through a very directed format that considers alternate solutions, and/or conjectures and/or evidence | Teacher-student interactions facilitate students through a flexible format that considers alternate solutions, and/or conjectures, and/or evidence | Whole lesson is dedicated to students discussing, exploring and critiquing/ considering alternate solutions, and/or different ways of interpreting evidence, with minimal teacher guidance |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------|^----------------------------------------------------------------|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| 0                                                                                           | 1                                                                                                         | 2                                                                               | 3                                                                                       | 4                                                                                       |

**Comments:** Reformed teaching shifts the balance of responsibility for mathematical or scientific thought from the teacher to the students. A reformed teacher actively encourages this transition. For example, in a mathematics lesson, the teacher might encourage students to find more than one way to solve a problem. This encouragement would be highly rated if the whole lesson was devoted to discussing and critiquing these alternate solution strategies.
23) In general the teacher was patient with the students

<table>
<thead>
<tr>
<th>No opportunity to assess or teacher was not patient (no wait time, answers own questions). Unwanted behavior is tolerated/ignored</th>
<th>There is a bit of wait time after asking a question, instructor avoids answering his/her own questions. Or instructor works with student(s) to clarify their vague question</th>
<th>Clear wait time (waiting for multiple student thoughts, waiting for all students have a chance to consider the question; not just taking the first raised hand or “shout out”).</th>
<th>Providing some time for student-student interaction (still on task), but may not be enough time for all to achieve goals.</th>
<th>Instructor provides adequate time for meaningful conversations to occur between students (enough time to achieve goal)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Comments
Patience is not the same thing as tolerating unexpected or unwanted student behavior. Rather there is an anticipation that, when given a chance to play itself out, unanticipated behavior can lead to rich learning opportunities. A long “wait time” is a necessary but not sufficient condition for rating highly on this item.

24) The teacher acted as a resource person, working to support and enhance student investigations (activity beyond answering a question)

<table>
<thead>
<tr>
<th>No investigations (activity that engages students to apply content through problem solving)</th>
<th>Very teacher directed, limited student investigation, very rote Rote response to student queries</th>
<th>Primarily directed by teacher with occasional opportunities for students to guide the direction Teacher-student co-guidance</th>
<th>Students have freedom, but within confines of teacher directed boundaries Student-driven direction of queries</th>
<th>Students are actively engaged in their own learning process, students determine what and how, teacher is available to help when needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>4</td>
</tr>
</tbody>
</table>

Comments: A reformed teacher is not there to tell students what to do and how to do it. Much of the initiative is to come from students, and because students have different ideas, the teacher’s support is carefully crafted to the idiosyncrasies of student thinking. The metaphor, “guide on the side” is in accord with this item.
The metaphor “teacher as listener” was very characteristic of this classroom—both D

<table>
<thead>
<tr>
<th>Teacher was the only “talker”</th>
<th>Teacher listened, and acknowledged or validated an idea presented at least once.</th>
<th>Teacher is listening throughout (from beginning to end), but doesn’t act on any ideas (but does acknowledge)</th>
<th>Teacher listens from beginning to end of lesson, but doesn’t necessarily act on ideas throughout</th>
<th>Teacher listens and acts on what students are saying from the beginning to the end of the lesson (from gaining prior knowledge all the way to assessing student understanding).</th>
</tr>
</thead>
<tbody>
<tr>
<td>No listening opportunity</td>
<td>0</td>
<td>Teacher listens opportunity (at least once) 1</td>
<td>Teacher listens throughout 2</td>
<td>Teacher listens throughout and acts continuously 4</td>
</tr>
</tbody>
</table>

**Comments:**
This metaphor describes a teacher who is often found helping students use what they know to construct further understanding. The teacher may indeed talk a lot, but such talk is carefully crafted around understandings reached by actively listening to what students are saying. “Teacher as listener” would be fully in place if “student as listener” was reciprocally engendered.
### Teaching Dimensions Observation Protocol Codes for Teaching Methods

<table>
<thead>
<tr>
<th>Teaching Methods</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lecture (LEC)</td>
<td>Instructor verbally presents facts or concepts.</td>
</tr>
<tr>
<td>Illustration (IL)</td>
<td>Instructor uses a story or anecdote to describe a fact or concept.</td>
</tr>
<tr>
<td>Demonstration (DEM)</td>
<td>Instructor uses a physical demonstration of a phenomenon</td>
</tr>
<tr>
<td></td>
<td>using experimental or other equipment.</td>
</tr>
<tr>
<td>Worked out problems (WP)</td>
<td>Instructor engages in the active solving of a numerical problem.</td>
</tr>
<tr>
<td>Small-group work (SGW)</td>
<td>Instructor directs students to work in pairs or small groups.</td>
</tr>
<tr>
<td>Desk work (DW)</td>
<td>Instructor directs students to work alone at their desks.</td>
</tr>
<tr>
<td>Case study (CS)</td>
<td>Instructor presents a case for detailed elaboration and analysis.</td>
</tr>
<tr>
<td>Online techniques (OT)</td>
<td>Instructor actively draws on the course website.</td>
</tr>
<tr>
<td>Rhetorical question (RQ)</td>
<td>Instructor poses a question as a figure of speech for illustrative</td>
</tr>
<tr>
<td></td>
<td>or persuasive reasons.</td>
</tr>
<tr>
<td>Display conceptual questions (DCQ)*</td>
<td>Instructor poses a question to obtain information about student</td>
</tr>
<tr>
<td></td>
<td>comprehension about concepts.</td>
</tr>
<tr>
<td>Display algorithmic questions (DAQ)*</td>
<td>Instructor poses a question to obtain information about student</td>
</tr>
<tr>
<td></td>
<td>comprehension about algorithms or computations.</td>
</tr>
<tr>
<td>Comprehension question (CQ)</td>
<td>Instructor poses a question to assess students’ generalized</td>
</tr>
<tr>
<td></td>
<td>understanding of a previous topic.</td>
</tr>
<tr>
<td>Novel question (NQ)</td>
<td>Instructor poses a question to which he or she does not know the answer.</td>
</tr>
<tr>
<td>Whole-class discussion (CD)</td>
<td>Instructor and students engage in back-and-forth discussion.</td>
</tr>
</tbody>
</table>

*These types of questions are frequently posed using clicker response systems. As a result, each of these questions is also coded in conjunction with clickers (i.e., DCQ-CL and DAQ-CL).

### Teaching Dimensions Observation Protocol Codes for Cognitive Engagement

<table>
<thead>
<tr>
<th>Cognitive Engagement</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receive/memorize information (RM)</td>
<td>Students hear facts and information with expectations only that they will internalize and recall information.</td>
</tr>
<tr>
<td>Understanding problem solving (PS)</td>
<td>Students follow solution paths or other analytic processes.</td>
</tr>
<tr>
<td>Creating ideas (CR)</td>
<td>Students engage in brainstorming activity at their desks and report back to the class with their ideas.</td>
</tr>
<tr>
<td>Integrating ideas (IN)</td>
<td>Students actively reflect on prior knowledge and its relationship to new information.</td>
</tr>
<tr>
<td>Connecting to the real world (CN)</td>
<td>Students relate course material to common experiences or aspects of their daily lives.</td>
</tr>
</tbody>
</table>

### Teaching Dimensions Observation Protocol Codes for Instructional Technology

<table>
<thead>
<tr>
<th>Instructional Technology</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Demonstration equipment (D)</td>
<td>A ball suspended from the ceiling, or laboratory equipment such as beakers.</td>
</tr>
<tr>
<td>Laptop and slides (LC)</td>
<td>A laptop computer connected to a digital projector that displays slides on a screen.</td>
</tr>
<tr>
<td>Posters (PO)</td>
<td>Posters on the wall, such as the Periodic Table.</td>
</tr>
<tr>
<td>Book (B)</td>
<td>A textbook or other book physically used by the faculty member.</td>
</tr>
<tr>
<td>Pointers (P)</td>
<td>Laser pointers used to shine a focused light on a screen.</td>
</tr>
<tr>
<td>Clicker response systems (CL)</td>
<td>Handheld devices with which students indicate answers to multiple-choice questions projected onto a screen.</td>
</tr>
<tr>
<td>Overhead projector (OP)</td>
<td>A projector that displays images or writing on transparent sheets of plastic.</td>
</tr>
<tr>
<td>Digital tablet (T)</td>
<td>A computer that displays images or writing directly onto a screen.</td>
</tr>
<tr>
<td>Blackboard/whiteboard (BB)</td>
<td>A blackboard or whiteboard (i.e., dry-erase board) hung on walls at the front of a classroom.</td>
</tr>
<tr>
<td>Miscellaneous object (OB)</td>
<td>A miscellaneous instructional artifact not captured by other codes.</td>
</tr>
</tbody>
</table>
# Teaching Dimensions Observation Protocol (TDOP): Coding Section

Notes:
What did my Students Think?
Building Surveys for Student Feedback

- Is it important to know what students think about your redesigned course?
- How can you find out what’s working and not working from the learners’ perspective?
- How can you use this feedback as input to continuous improvement of your redesigned course?
The purpose of this document is to guide you through the process for developing a survey that allows you to incorporate students’ perceptions of your redesign efforts into the ongoing assessment of the project. Several resources are provided for you to reference when working through the development of a survey.

Objectives: The first thing to do when developing a survey is to list your objectives for surveying students in your course. Some of the objectives that were discussed at the workshop include:

1) To measure effectiveness (of activities, instructor, balance between student-to-student interaction and instructor-to-student interaction).
2) To improve teaching practices
3) To meet the expectations of STEM Gateway (the funded proposal commits to including student attitudes toward the redesigned courses as part of the overall program evaluation)

Question Construction: The objectives should drive the item construction for the survey. Some things to consider when developing questions are:

a) To what extent should the questions be open-ended versus objective response?
   b) Should objective items be posed as a question or a statement?
   c) If questions are objective, what Likert scale should be used? See the Likert Scale document for ideas.
   d) Should ‘neutral’ be an option?

Review the examples below. The first example frames the item as a question and gives a neutral option. The second question frames the item as a statement which students can agree with to varying degrees and does not include a neutral option. What are the advantages and disadvantages to the various approaches? What approach is best for your purpose?

Examples:
1a. How effective were pre-class assignments in terms of preparing you for lecture?
   A. Very effective
   B. Somewhat effective
   C. Neutral
   D. Somewhat ineffective
   E. Very Ineffective

1b. Pre-class assignments were effective for preparing me to learn from the lecture.
   A. Strongly agree
   B. Agree more than disagree
   C. Disagree more than agree
   D. Strongly disagree
The questions below were suggested by members of the course reform teams. They provide a basis of ideas that can be used or modified.

**Example questions suggested by redesign teams at the workshop**

1) What would you define as success in the course? - A,B,C,D,F
2) What is your most recent grade estimate? - A,B,C,D,F
3) At the beginning of the semester, I was... Skeptical, neutral, enthusiastic
4) Now, I am... Skeptical, neutral, enthusiastic
5) How well did you learn?
6) How well did you enjoy the material?
7) Are you aware of the learning outcomes from the course?
8) Did you use the learning outcomes to study?
9) How well did the material provided (in-class activities, worksheets, pre-class assignments) prepare you to achieve the learning outcomes?
10) How well did the pre-class activities prepare you for the in-class activities?
11) Did the assignments align with the exams?
12) Did the exams align with the learning outcomes?
13) Would you recommend the course to a friend?
14) What could be changed about the class to improve learning?
15) What can the instructor do to improve learning?
16) What can you do to improve learning?
17) What changes did you make to improve your learning? Were the changes effective?

*Several other example surveys are included in the zip file for you to review and use to help generate questions.*

**Bookending a Survey** - After listing objectives and constructing items to assess the objectives, it is good practice to bookend the survey with an introduction and closing.

**Introduction** - It is important to introduce your survey to the audience. Things to consider adding to the introduction are listed below:

- The purpose
- The intended use
- The intended follow-up (how the information will be used)
- Privacy protection
- Instructions to complete the survey

**Closing** - It is also good practice to close the survey by expressing gratitude to the participants.

*Thank you for your thoughtful responses.*
**Timing for administration**- Deciding when to administer the survey largely depends on the objectives of the survey.

Do you want information to improve teaching practices on the fly during the semester? Do you want to measure the effectiveness of the materials and instructional approaches to make changes for the next semester? Aligning the timing to the objectives will ensure that you obtain the data you need at the time you need it.

**Platforms for administration**- There are several platforms that can be used to survey students. Listed below are several of the platforms that were discussed and the pros and cons to consider when choosing a platform. For an alternative list of platforms and their advantages and disadvantages, see the attached document *Survey Methodology*.

*Blackboard Learn*- Blackboard Learn has a survey feature. This will allow you to know which students have taken the survey although the responses themselves are anonymous. You will not be able to link responses to respondents. You can incentivize students by issuing extra credit for survey completion.

*Opinio*- UNM has a license to Opinio, a surveying program. It is free to use after you set up an account by submitting a ticket request to IT at [https://help.unm.edu/CherwellPortal/SSS/WinLogon](https://help.unm.edu/CherwellPortal/SSS/WinLogon). You will not be able to tell which students have responded using Opinio.

*Google Docs*- You can create surveys and collect data using a Google tool.

*In-class Handout*- The benefit of using a hardcopy survey is a higher response rate. However, unless using a Scantron, you will have to input all the data by hand. Even using a Scantron, you will have to input open-ended responses by hand. Survey administration also needs to be budgeted into your class time.

*IDEA Form*- You can add customized questions to the IDEA form. The benefit of this is limiting the surveys students need to take. The drawback is restricting the number of questions you can ask.

**Wrap up**

By thinking through the sections above, you enable yourself to create a survey to meet your listed objectives. If you have any specific questions, contact gsmith@unm.edu or astark@unm.edu. We would love for you to share your surveys with us and other course reform team members. Please feel free to send out a copy of the survey you develop to members of the other course reform teams.

Also – After completing your analysis of survey results, please forward (a) the instrument you used, and (b) a results summary to Gary and Audriana for incorporation into the project-evaluation files.
Example survey

1. So far, the pace of the class has been...
   a. Too slow
   b. Just right
   c. Too fast

2. Exam 1 was...
   a. Much harder than I thought it would be
   b. Somewhat harder than I thought it would be
   c. Pretty much what I thought it would be
   d. Somewhat easier than I thought it would be
   e. Much easier than I thought it would be

3. My educational background has so far provided me with the information and skills I have needed to succeed with the new learning in this course:
   a. Always or almost always
   b. Usually
   c. Sometimes
   d. Rarely
   e. Never

4. Choose the answer that comes closest to your current attitude toward this class. So far, ...
   a. ...the course has been a lot of work, but I feel like I am learning.
   b. ...the course has been a lot of work, and I don't feel like I am learning much.
   c. ...the course has been pretty easy, but I feel like I am learning.
   d. ...the course has been pretty easy, and I don't feel like I am learning much.

5. What is your overall rating of the course, so far:
   a. One of the best courses I've taken
   b. Better than most courses I've taken
   c. About the same as most other courses that I've taken
   d. Worse than most of my past courses
   e. One of the worst courses that I've taken

6. What is your overall rating of the Professor's effectiveness at promoting your learning, compared to other instructors?
   a. Among the most effective instructors that I've had
   b. More effective than most instructors
   c. About the same effectiveness as other instructors
   d. Less effective than most instructors
8. What is your overall rating of your laboratory teaching assistant's effectiveness at promoting your learning, compared to other graduate-student instructors?
   a. Among the most effective graduate-student instructors that I've had
   b. More effective than most graduate-student instructors
   c. About the same effectiveness as other graduate-student instructors
   d. Less effective than most graduate-student instructors
   e. Among the least effective graduate-student instructors I have had

10. The Peer Learning Facilitator, has been very helpful to me when I meet with him outside of class.
   a. Strongly Agree
   b. Agree
   c. Neither Agree nor Disagree
   d. Disagree
   e. Strongly Disagree
   f. Not Applicable

11. How useful are the In-Class assignments in helping you learn?
   a. Almost always useful
   b. Mostly useful
   c. Sometimes useful
   d. Rarely useful
   e. Almost never useful

12. How useful are the online Learning Checks, and the provided feedback, in helping you to identify your learning progress?
   a. Almost always useful
   b. Mostly useful
   c. Sometimes useful
   d. Rarely useful
   e. Almost never useful

13. How does working with classmates help in your learning of new ideas and concepts during in-class assignments?
   a. Working with classmates helps me to discuss new ideas/concepts which leads to a deeper understanding
   b. Working with classmates does not help me to understand new ideas/concepts
   c. Working with a classmate slows down my work and I learn less

14. How useful are the Think-Pair-Share and Write-Pair-Share activities in class for helping you learn?
   a. Almost always useful
   b. Mostly useful
c. Sometimes useful
d. Rarely useful
e. Almost never useful

15. How does working with a lab partner help in your learning of new ideas and concepts during lab sessions?

a. Working with a partner helps me to discuss new ideas/concepts which leads to a deeper understanding
b. Working with a partner does not help me to understand new ideas/concepts
c. Working with a partner slows down my work and I learn less

16. How often do you effectively complete the assigned reading before class? Effective reading isn't the same as skimming. Effective reading includes thinking about, or maybe writing out answers to, the reading questions before class.

a. Before almost every class session
b. On average, before 2 out of the 3 class sessions each week.
c. On average, before 1 out of the 3 class sessions each week
d. Only 2-3 times so far this semester
e. Almost never

17. During most in-class exercises ...

a. ... my partners and I are equally prepared to complete the exercise because we did the reading beforehand.
b. ... my partner(s) and I are equally unprepared to complete the exercise because we did not do the reading beforehand.
c. ... I am usually prepared but my partner(s) is not... but that doesn't bother me.
d. ... I am usually prepared but my partner(s) is not... and that does bother me.
e. ... I am usually not as prepared as my partner(s), because they did the reading assignments and I did not.

18. How often do you attend office hours for either the professor or the TA and how has it increased your understanding of new concepts?

a. I regularly attend office hours to help me understand new concepts
b. I sometimes attend office hours only when I am not able to understand new concepts
c. I never attend office hours because I am able to understand new concepts
d. I never attend office hours and do not understand new concepts

19. My interest level in this class before I signed up for it can best be described as

a. Very interested
b. Somewhat interested
c. Neutral; neither interested nor disinterested
d. Somewhat disinterested
e. Very disinterested

20. As a result of taking this course, so far my interest level in the study can best be described as:
   a. Greatly increased since starting the class
   b. Somewhat increased since starting the class
   c. About the same as before starting the class
   d. Somewhat decreased since starting the class
   e. Greatly decreased since starting the class

21. Explain one thing that would increase your learning in this class.
   Answer:

22. Explain one thing that your laboratory teaching assistant could do that would increase your learning in this class.
   Answer:

23. Explain one thing that you could do to that would increase your learning in this class.
   Answer:

24. Use this space to offer any additional comments about your course experience so far, and/or suggestions for improving this experience.
   Answer:
1. How effective were the pre-class assignments in terms of preparing you for the lecture?
   - Very ineffective
   - Somewhat ineffective
   - Neutral
   - Somewhat effective
   - Very effective

2. How effective were the lectures in terms of preparing you to understand the homework?
   - Very ineffective
   - Somewhat ineffective
   - Neutral
   - Somewhat effective
   - Very effective

3. How effective were the in-class group assignments in terms of preparing you to understand the homework?
   - Very ineffective
   - Somewhat ineffective
   - Neutral
   - Somewhat effective
   - Very effective

4. How effective was the homework in terms of preparing you for quizzes and exams?
   - Very ineffective
   - Somewhat ineffective
   - Neutral
   - Somewhat effective
   - Very effective

5. How effective were the Student Learning Outcomes (SLOs) in terms of guiding your study for exams?
   - Very ineffective
   - Somewhat ineffective
   - Neutral
   - Somewhat effective
   - Very effective
STSS Research Project: Student Survey

Welcome to the University of Minnesota STSS research survey! This survey is part of a study designed to learn more about student perceptions of and experiences in classrooms such as this one. This study is completely voluntary and will not affect your grade in this class or your relationship with your instructor or the University; survey data will be kept strictly confidential. The survey should take about 10-15 minutes to complete.

Questions:

1. Student ID #: ________________________________

2. Course/Section: ________________________________

3. Room: ________________________________

4. What grade do you expect to earn in this course?
   ○ A
   ○ B
   ○ C
   ○ D
   ○ F
   ○ Other (Please specify): ________________________________

5. Prior to this course, have you ever taken a class in a room like this at the University of Minnesota?
   ○ Yes
   ○ No

59. Please describe one situation in which this room WORKED WELL for you. Provide as many details as possible.
60. Please describe one situation in which this room DID NOT WORK WELL for you. Provide as many details as possible.

61. What are your overall thoughts about the classroom in which you are taking this course?

THANK YOU FOR YOUR TIME AND THOUGHTFUL RESPONSES!
Debriefing and Looking Ahead—What did We Learn During the Fall?

- What changes do we need to make for next semester?
- What information will be used to trigger adjustments?
- How will the team plan the adjustments?
- What milestones and goals did we meet?
- What milestones and goals do we still have?
Debriefing and Looking Ahead

Course Redesign 2015-2016 Reflection Form

STEM Gateway would like to document the experiences of the Course Reform Teams Cohort 4. Please take time to formulate thoughtful responses to the questions below. Then, bring a copy of the completed form to the December meeting to share your insights with other course redesign teams.

1. What aspects of your redesign have worked well?

2. What are challenges you have faced with your redesign efforts?

3. How will you address issues that you are facing for the spring semester?
4. How have you made your work known to colleagues in the department?

5. How have you kept your department chair informed of your work?

6. What do your chair and colleagues think about your work?
Why Aren’t My Students Learning?

- Are you blaming your students for low achievement?
- What might be happening?
- How might you assist students’ achievement of outcomes in your course?
Why Aren’t All of My Students Learning?
Gary Smith and Audriana Stark

Outcomes:
You will be able to:
• Explain the reasons that may account for at least two issues that you have about unsatisfactory student learning.
• Outline interventions to your current instruction that are designed specifically to resolve the issues you face with student learning.

Why Aren’t All of My Students Learning?

Why some students don’t do well in our classes

How do you suppose students respond when they are asked why they don’t do well in our classes?

“IT’S NOT ME; IT’S THE TEACHER/TEST/MATERIAL THAT IS CAUSING MY POOR LEARNING PERFORMANCE.”

Image at: http://sfhelp.org/art/accuse.gif
What is it?

Vase or Face?
Student or Teacher?

Look at your lists---

What student factors do we attribute a lack of learning to?

What other student situational factors could be causing poor student performance?

Attribution

Attributions are explanations for events and behaviors.

Fundamental Attribution Error
When explaining other's behavior, people tend to...

- ... overestimate internal, personal factors
- ... underestimate external, situational factors

Who are my students?

Photos by: UNM
UNM students work more hours (primarily off campus) than the average US college student.

About 40% of UNM freshmen and 50% of seniors provide care to parents, children, and/or siblings (16% of seniors commit >30 hrs/wk to this obligation).

UNM students are more likely to be care givers in their families.

UNM students are more likely than their national peers to be working to support themselves, their family, or both.

For family or health reasons

Class is boring; professor teaches poorly

I have work to do in other classes

I don’t feel like going

I am doing well in the class

What is the main reason why you miss/skip class?

Personal concerns and teaching quality are the primary variables determining UNM student attendance.

Source: Profile of the American College Student, 2008

Source: 2009 NSSE
UNM students are, compared to the national college-student population, more likely to be financially under-resourced.

Some 2014 statistics:

- New Mexico ranks 43rd in median family income
- 42% of UNM undergraduates receive Pell Grants (more than any other public flagship university, which average ~20%)
- New Mexico ranks worse in the percentage (31%) of children living in families with incomes defined below the poverty level.

In a single, semester-long class with 49 students, I worked with students who confided these ongoing life issues:

- Two veterans with diagnosed PTSD
- Two spouses of servicemen who were deployed in theater
- One whose wife unexpectedly began a divorce action and left him with their 2 children
- One who was providing hospice to his dying mother in his own home, while caring for both his and his mother’s livestock on different properties
- One who discovered that her fiancé was cheating with her best friend
- One persevering through infections caused by a congenital problem that awaited impending surgery
- One dealing with fallout of pulling away from her family related to seeing her stepfather abuse her brother

Fundamental Attribution Error

When explaining their own behavior, people tend to ...

... underestimate ... overestimate

internal, personal factors external, situational factors

Look at your lists---
What instructor factors do we attribute a lack of learning to?
For your course:
• what can you control?
• what is out of your control?

How can exercises like this keep teachers and students from blaming one another for a lack of learning in the classroom?

A Story
Two students, Pat and Chris, each receive D’s on their first exam in Algebra. Pat dismayed and disappointed, gives up on the course and any chance of a career in STEM. Chris, surprised and shocked, doubles down on studying and working on the course determined to do better.

How do these two students differ?
"I'm just not good at this stuff."

What student attitude do you desire in your course?

For each statement below, select a letter that represents your desired expectation of students in the continuum from A to E.

<table>
<thead>
<tr>
<th>Statement</th>
<th>A</th>
<th>B</th>
<th>C</th>
<th>D</th>
<th>E</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. I like coursework that I’ll learn from even if I make some mistakes along the way</td>
<td>A</td>
<td>B</td>
<td>C</td>
<td>D</td>
<td>E</td>
</tr>
<tr>
<td>A. It's much more important to me to learn new things in my classes than it is to get the best grades.</td>
<td>A</td>
<td>B</td>
<td>C</td>
<td>D</td>
<td>E</td>
</tr>
<tr>
<td>A. I like coursework best when it makes me think hard.</td>
<td>A</td>
<td>B</td>
<td>C</td>
<td>D</td>
<td>E</td>
</tr>
</tbody>
</table>

How can you help students realize their current mindset and move to a growth mindset?

- Increase Awareness
- Encourage Students

Exploring Self-Theories

<table>
<thead>
<tr>
<th>Growth Theory Mindset</th>
<th>Fixed Theory Mindset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local, changeable judgments about intelligence and ability: If you work harder you'll do better.</td>
<td>Global, fixed judgments about intelligence and ability: You're either smart or you're dumb.</td>
</tr>
<tr>
<td>Effort is the way of accomplishing goals: If you want to succeed, you'll try harder.</td>
<td>Effort is a sign of low ability: If you have to try hard, you must not be smart.</td>
</tr>
<tr>
<td>Attuned to feedback: filters out evaluation.</td>
<td>Attuned to evaluation: filters out feedback.</td>
</tr>
<tr>
<td>Learning goals: Seeks to increase competence.</td>
<td>Performance goals: Seeks to win positive evaluations (grades) and avoid negative ones.</td>
</tr>
<tr>
<td>Response to failure: Increased effort; adopt a new learning strategy.</td>
<td>Response to failure: Excuses, avoidance, withdrawal from course; failure is a sign of low ability.</td>
</tr>
</tbody>
</table>

(adapted from Dweck, 1999, and Tagg, 2003)
Let's take a deeper look into some of the other concerns listed.

Reflect in your journal ...

- Explain the reasons that may account for at least two issues that you have about unsatisfactory student learning.
- Outline interventions to your current instruction that are designed specifically to resolve these two issues that you face with student learning.

Starting the Semester: Making Sure Learners are On Board with Your Redesign

- Motivate students to learn cooperatively in groups/teams
- Guiding questions provide students with a roadmap for class preparation
- Many students lack adequate comprehension of how to learn from text
- Students use ineffective strategies for learning

Making Sure Learners are On Board with Your Redesign

What is the most important goal of your college education and, therefore, of this course?
A. Acquiring information (facts, principles, concepts)
B. Learning how to use information and knowledge in new situations
C. Developing lifelong learning skills
How students actually answer this question

What is the most important goal of your college education and, therefore, of this course?

A. Acquiring information (facts, principles, concepts) 7%
B. Learning how to use information and knowledge in new situations 38%
C. Developing skills to continue learning after college 55%

(quantitative n = 1377)

First-day questions for the learner-centered classroom, G.A. Smith, National Teaching and Learning Forum, Sept. 2008

How do learners want to learn?

Attempt learning on their own, outside of class
A. Acquiring information (facts, principles, concepts)
B. Learning how to use information and knowledge in new situations
C. Developing lifelong learning skills

Prefer learning in class, working with peers and instructor

Learning “venues”:

Learning on your own  Learning in class with others

Of the three goals, which do you think you can make headway on outside of class by your own reading and studying, and which do you think would be best achieved in class working with your classmates and me?
Motivate students to learn cooperatively in groups/teams

How important is it, to you, to develop skills in your coursework that will help you land a job when you graduate?

Can you pick which four in the following list are among the top 5 most desired characteristics among recent college graduates as reported by hiring companies?

1. Creativity
2. Computer skills
3. GPA, cutoff above 3.0
4. Leadership skills
5. Problem-solving skills
6. Teamwork skills
7. Verbal communication skills
8. Written communication skills
9. Analytical/quantitative skills

Employers rate the importance of candidate skills/qualities

<table>
<thead>
<tr>
<th>Skill/Quality</th>
<th>Weighted Average Rating</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ability to work in a team structure</td>
<td>4.61</td>
</tr>
<tr>
<td>Ability to make decisions and solve problems</td>
<td>4.61</td>
</tr>
<tr>
<td>Ability to verbalize and communicate</td>
<td>4.64</td>
</tr>
<tr>

<tr>
<td>Ability to sell or influence others</td>
<td>3.56</td>
</tr>
</tbody>
</table>

Employer-desired skill that matches a learning outcome for this course
Positive interdependence

Individual accountability

Roles of group members

Guiding questions provide students with a roadmap for class preparation

Assignment for Monday:

Read the Leiden today.

Chapter 5, Section 5.5: Climate Basics

Check your reading comprehension. Be able to answer these questions before coming to class:

1. What is a GWB and how does it affect climate?
2. What is the greenhouse effect? What is the greenhouse effect?
3. What are the potential causes of climate change? Other than warming?
4. How do atmospheric emissions impact climate?
5. How do emissions affect the climate? What is the greenhouse effect? What is the greenhouse effect?
6. Why do we need to reduce our emissions? To decrease carbon dioxide levels and mitigate climate change?
7. Explain how the effects of temperature and humidity affect climate.
8. Can you apply the principles of atmospheric scientists to the cause of global warming and explain the climate of San Francisco.

Additional Resources:

There are some flash animations on the web site that describe Global Warming, the Greenhouse Effect, and Ocean Winds. These animations may be helpful to your comprehension of the key parts of the topic.

Guiding questions improve reading comprehension, especially for less-skilled readers

Stigler-Balfour and Benassi, 2012, Guiding questions advance reading comprehension
College students read a passage and then, after a 2-minute delay, either reread the passage (the study-study condition) or wrote as much of the information as they could recall (study-test).

Respondents were given a final test after a test delay (or “retention interval”) of 5 minutes, 2 days, or 1 week.

Provide resources to students to improve learning from reading

SQ3R: SURVEY – QUESTION – READ – RECITE – REVIEW

SURVEY
- Check organization of material, general content, headings, subheadings, side-bars.
- Look over maps, diagrams, charts.
- Read introduction, conclusion.

QUESTION
- Ask yourself what you want to learn from this reading.
- Ask questions about headings, subheadings as you work through them.
- Form questions about each section.
- Try “who, what, when, where, why, and how” questions. How does this section relate to the others? Some textbooks have study questions at the end of the chapter.

READ
- Read material in chunks.
- Look for and respond to the questions you posed previously as you read.

RECITE
- Check your recall of the material.
- Can you answer the question you formulated? Put the material into your own words. Talk about what you have read.

REVIEW
- After you have read the whole assignment, look over your notes.
- Go for the large picture.
- Notice how the ideas are linked.
- Try to recall the main points.
- What are the subordinate points for those main ideas?

Many students lack adequate comprehension of how to learn from text

SQ3R: SURVEY – QUESTION – READ – RECITE – REVIEW
- SURVEY
  - Check organization of material, general content, headings, subheadings, side-bars.
  - Look over maps, diagrams, charts.
  - Read introduction, conclusion.
- QUESTION
  - Ask yourself what you want to learn from this reading.
  - Ask questions about headings, subheadings as you work through them.

  - What are the subordinate points for those main ideas?
**3R strategy generates greater learning and retention**

(McDaniel et al., 2009, Psychological Science, 20(4) 516-522)

---

**Do your students, and you, know what approaches to studying are most effective for learning?**

What do you think are the strategies most used by students?

- Self-explanation
- Summarization
- Highlighting/underlining
- Rereading
- Practice testing
- Distributed practice

How can our instructional strategies improve student learning?

**Misconceptions about learning impede student success**

(McDaniel et al., 2013, Psychological Science in the Public Interest, 14(1), 4-58)
Learning outcomes: After this session, you will be able to...

...Explain the reasons that may account for at least two issues that you have about unsatisfactory student learning.

..Outline interventions to your current instruction that are designed specifically to resolve the issues you face with student learning.

Agenda

I. What is frustrating you about student learning? What is the problem? What do you think is happening?
II. Attribution Theory ... Students point fingers, too.
   What characteristics of successful student learning are in/out of my control?
III. Mindsets – self theories about learning
IV. Potential solutions for why students don’t do well
V. Write in journal- reflection
Brainstorming Activity: Examining Attribution Theory

1. Think of a typical course you teach. In the table below, write down as many ideas as possible that you control about the course. Then, list as many ideas as possible of elements that you cannot control about the course.

<table>
<thead>
<tr>
<th>Can Control</th>
<th>Can’t Control</th>
</tr>
</thead>
</table>

Learner Mindsets

What student attitude do you desire in your course?
For each statement below, circle a letter that represents your desired expectation in the continuum from statement A to B.

<table>
<thead>
<tr>
<th>A. I like coursework that I’ll learn from even if I make some mistakes along the way</th>
<th></th>
<th></th>
<th></th>
<th></th>
<th>E. I mostly like coursework that I can do perfectly without any mistakes.</th>
</tr>
</thead>
<tbody>
<tr>
<td>A. It’s much more important to me to learn new things in my classes than it is to get the best grades.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>E. I would rather get a good grade in a class than learn a lot.</td>
</tr>
<tr>
<td>A. I like coursework best when it makes me think hard.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>E. The main thing I want when I do my coursework is to show how good I am at it.</td>
</tr>
</tbody>
</table>

Self-Theories of Intelligence – Individual’s Mindsets about Learning

<table>

Meaningful Learning from Text through Purposeful Reading: SQ5R

SURVEY
- Check organization of material, general content, headings, subheadings, side-bars.
- Look over maps, diagrams, charts.
- Read introduction, conclusion.

SURVEY - Before reading in earnest, read the introduction and summary or abstract (if provided). Skim through the reading material and pay attention to topic headings, bold-faced or italicized words, pictures, charts, and graphs. These items can give you an idea of the general structure and content before you begin reading. If provided by your teacher, examine the questions provided with the reading assignment to make yourself aware of what is most important to know before class. The survey step prepares your brain to capture knowledge from the reading because you are aware of what the reading is about; think of it as analogous to doing stretching exercises before undertaking strenuous activities.

QUESTION
- Ask yourself what you want to learn from this reading.
- Ask questions about headings, subheadings as you work through them.
- Form questions about each section.
- Try “who, what, when, where, why, and how” questions. How does this section relate to the others? Some textbooks have study questions at the end of the chapter.

QUESTION - Set a purpose for your reading by developing questions about the material before you start reading. Use the topic and heading information that you gathered in the survey step to create questions to be answered while you read. Begin asking yourself who, what, where, when, why, and how questions. Questions are most beneficial when they are general and cover the main topics and important points identified during the survey step.

READ
- Read material in chunks.
- Look for and respond to the questions you posed previously as you read.

READ – If the text is not already divided by closely spaced section headings, break the material into sections that will take no more than about 20 minutes to read. Read the assignment section by section. Look for answers to your questions (and the questions that accompany the assignment, if provided), key concepts, and supporting details. After reading each section, think about the material you have just read and answer the questions you have asked. Look carefully at the charts, graphs, tables, and pictures; these can serve to present new information as well as tie together concepts from the reading.

RECORD
- Record key points of what you have learned using your preferred method of note-taking.
- Highlight key words or phrases; make an audio record of key ideas; write out the points in short form.

RECORD - Go back and underline or highlight key concepts and take notes. Note can be made on a separate sheet of paper, on note cards, in the margins of the reading, or any way that works well for you. But always be sure that you’re writing something in your own words in order to improve your brain processing of what you’re reading (Do this after each section.)
RECITE

- Check your recall of the material.
- Can you answer the question you formulated? Put the material into your own words. Talk about what you have read.

RECITE - Next, look away from the material and try to recite the key information and ideas. Put the material in your own words and go back and re-read until you feel comfortable with it. This may be frustrating at first, but it will lead to better understanding and save you review time in the long run. You don’t like talking to yourself? Pets can be good listeners! (Do this after each section.)

Repeat the Read – Record – Recite steps for each section of the text

REVIEW

- After you have read the whole assignment, look over your notes.
- Go for the large picture.
- Notice how the ideas are linked.
- Try to recall the main points.
- What are the subordinate points for those main ideas?

REVIEW - After completing the entire reading assignment, scan back over the text and review the information aloud or in your head. Talk about the material with a classmate if possible (perhaps with a teammate before class starts). Try to identify overall themes and relationships between concepts. Make any necessary revisions of your notes or markings so they can be easily understood later.

REFLECT

- How does the material you learned fit in with what you already know?
- Consider class notes, previous learning, class discussion etc.

REFLECT- Deep, memorable learning involves connecting newly learned information and ideas with what you already know. In nearly all courses, reading assignments are not meant to stand alone but are, instead, interconnected with previous topics, upcoming topics, and learning opportunities that take place during class time. Immediately after completing the assignment, contemplate how it fits in with what else you’re learning in the course and what you knew about this topic beforehand. Later, come back to your notes and see if subsequent learning opportunities in the course permit you to elaborate on what you initially learned while reading.

Does this seem like it will take a lot of time? It can, so don’t wait until the night before a test to assume that you can purposefully read your assignments for meaningful learning. Many students find that when they don’t take these steps they frequently find themselves lost or distracted during their reading and frequently start over or end up re-reading. When they follow SQ5R, however, they find themselves spending less time on the reading assignment because they only read it once.

(Parts of this document were adapted from: LGresham/Learning Skills Advisor/Conestoga College Learning Strategies/reading/SQ5R.doc at http://www.scribd.com; Reading Tips at http://www.radford.edu/content/LARC/home.html)
Do your students, and you, know what approaches to studying are most effective for learning?

Checking Your Alignment

• Are your outcomes, learning activities, and assessments appropriately aligned?
• Do you provide scaffolding opportunities to raise students from low-level thinking to high-level thinking?
Outcomes:
Participants will be able to:

- demonstrate alignment of outcomes, learning activities, and assessments using Blooms taxonomy of the cognitive domain

- demonstrate how sequencing of learning activities and assessments scaffold student achievement to desired outcome levels “teachable units”

Outcomes should align with classroom learning and assessment

Bloom’s taxonomy is a model for designing courses by aligning ...

What students are assessed as knowing and doing ...

... with what students are asked to do in order to master learning

... with the outcomes of the course – what students should know and be able to do upon completion
Bloom’s taxonomy defines a matrix for at-a-glance classification of outcomes classroom learning, and assessments.

Course learning outcome:
Students will be able to write original compositions that analyze patterns and relationships of ideas, topics, or themes.

Weekly learning outcome:
1. Know the specific parts of the Parliamentary Acts (e.g., Sugar, Stamp, Townshend Acts)
2. Explain the consequences of the Parliamentary Acts for different colonial groups.

Assessed by test questions.

An additional assignment:
• Choose a colonial character or group and write a persuasive editorial stating his/her/its position on the Parliamentary Acts (the editorial must include at least one supporting reason not specifically taught or covered in class).

1. Plot this History program outcome with an “X” within one (or more?) squares on the above Bloom’s taxonomy matrix:

   *Students will be able to write original compositions that analyze patterns and relationships of ideas, topics, or themes.*

**Please stop here for discussion!**

2. Plot these course objectives that a teacher intends to assess with test questions:

   *Students will:*
   1. **Know the specific parts of the Parliamentary Acts (e.g., Sugar, Stamp, Townshend Acts)**
   2. **Explain the consequences of the Parliamentary Acts for different colonial groups**

**Please stop here for discussion!**

3. Plot this additional assignment:

   *Choose a colonial character or group and write a persuasive editorial stating his/her/its position on the Parliamentary Acts (the editorial must include at least one supporting reason not specifically taught or covered in class).*

**Please stop here for discussion!**

4. What benefits would come from adding this step to the assignment?
   - **Provide a peer review a draft of one colleague’s editorial.**
   - **Self review and edit your editorial**
   - **Turn in your revised editorial**

STEM Gateway
Course Redesign Teaching Professional Development Program:

Closing the Loop: How to Evaluate your Accomplishments

- Did the redesign project achieve its goals?
- What information will you need to evaluate project success?
- How will you obtain that information?

Sustaining STEM Course Redesign

What does it mean to sustain the redesign?

Sustaining redesign means assuring that your hard work and goals for further innovations to improve student learning persist beyond the STEM Gateway program. Sustaining your redesign means to maintain the momentum that you have and your motivation for continuous improvement of your curriculum.

Sustaining also means to expand your redesign to other instructors. This aspect is important in order to attain greater consistency in learning experiences across all sections of the course and to assure the implementation of your changes with a continued spirit of improvement, as teaching assignments change and different instructors assume teaching roles in the redesigned course.

Sustaining your pedagogical changes also requires a supportive environment of colleagues. Your motivation to continue your work as innovative teachers will be enhanced within a culture that values teaching. This may even lead to additional redesign projects among your colleagues that will improve student learning experiences across a larger curriculum rather than only within individual courses.

Essential factors for continuing your innovations and encouraging innovative teaching among your colleagues

We wrote this guide as a menu of ideas that you can choose from that are based in decades of scholarly research about change processes. Here are the essential overarching ideas to keep in mind.

Focus on the Advantages for Change

Dissatisfaction is a common catalyst for change. Even though you may have achieved the primary goals for your redesign project, keep asking: “What isn’t working well? How could this be better?” Initiate conversations with colleagues about their concerns for student learning, the goals of teaching, and the roles of courses within your curriculum. Be willing to share your progress to illustrate how others can benefit from adopting your changes or undertaking changes of their own. Sharing of resources, knowledge, and stories related to course design can create a synergistic effect that can make your efforts together greater than the sum of separate efforts.

Be Strategic in Your Efforts to Persuade Others

Although scientists commonly call upon data to support an argument, people seldom adopt changes because of data. Showing results from your redesign could be beneficial to demonstrating an advantage to change but persuading people to teach differently will likely require additional support from you or others. We rarely discard what we know in order to take up something that is unfamiliar, especially if the change seems particularly complex or complicated. Seeing an innovation at work enhances adoption, so invite colleagues to visit your classes and show them your instructional materials. Share your materials, offer advice, and point colleagues to useful resources that they can use in order to keep their change work manageable, such as the use of Graduate and Teaching Assistants. Encourage colleagues to try out new approaches by combining them with or adapting them to existing practice and experience. Initial success with these modest changes can pave the pathway to greater innovation and higher fidelity implementation of your redesign elements. Open, collaborative communication channels
are essential for sustaining and enlarging the number of colleagues who are willing to be progressive with their teaching.

**Connect with the Values of Higher Education**

Universities are creators and disseminators of knowledge not only through research and other creative works but also through teaching and mentoring. Where possible, develop synergy between research and teaching by including research and publication about teaching. Involve graduate students in your education projects and mentor them to be better prepared, and more competitive, for future faculty positions.

**Be Resilient**

Celebrate immediate positive results but don’t expect them. Be prepared to support your colleagues who may be discouraged from investing additional effort. “Performance dips” are typical when implementing significant changes and improvement commonly requires building confidence, accumulating tacit knowledge with new methods, and learning from mistakes. Sharing stories of challenges and setbacks can help reluctant instructors adopt the mindset that views challenges or mistakes as learning opportunities that can improve practice. Vulnerability is essential to taking risks and being creative. Encourage people to persist through challenges, as you have done, and remain resilient throughout the process.

**Build a Culture of Teaching Excellence**

Sustainable innovations are built around supportive social systems. Social networks and communities of practice become sources of inspiration, learning, and a feeling of belonging to groups who share the value of being excellent teachers as measured by what students learn and are motivated to accomplish. These groups may exist within your department, or cross disciplinary boundaries, or both. Groups may be composed of people at various levels of the organization from graduate student to tenured faculty to department chairs. You can help to seed them and you can encourage department leadership to be opinion leaders for valuing teaching. Aligning values and inspiring a shared vision of improving teaching and learning in your department can mobilize your colleagues to build and maintain a culture of excellence in teaching.

Look for these elements as you use this guide as a handbook for sustaining your redesign project.
Continuously Improving Teaching and Learning

Effective course design is a continuous process. The steps for continuous instructional change are shown in the figure below, Instructional Change Process. Determining outcomes, designing instructional components, and evaluating results and making adjustments allows for growth as a teacher and improved learning experiences for students.

Without continual growth and progress, such words as improvement, achievement, and success have no meaning.

- Benjamin Franklin

Essential Questions
• How will you know that the course design is effective?
• How will you use what you learn when implementing new material to improve the way you teach?

Instructional Change Process

Motivation: What is the motive for redesigning your course?

Expectation: What should students learn?

Select: Which change option(s) will most likely succeed? Are the changes aligned to stated learning outcomes? What materials, tools, assignments, and assessments will need to be created or found?

Develop: What will learners do in order to master the outcomes? What will be the ingredients of the teachable units? How will learning be assessed in each unit?

Implement: How will the changes be implemented – in stages, with a pilot, all at once? Why? What professional development is needed? What additional resources are required?

Expand: How will the changes be expanded across instructors of the course?

Improve: What will trigger modifications? When will the modifications be made? Who will make them?

Evaluate: How will you know that the redesign is working? Are the stated learning outcomes being achieved? How are students responding? Are your outcomes, instruction, and assessments aligned?
Use data to inform decisions

• Collect data that can inform your teaching (student attitudinal surveys, pre-post concept inventories, exam questions, etc.)

• Analyze data to determine what is working and what is not working. Make adjustments as necessary.

This process can be enhanced through synergistic efforts with others who teach the course (See *Undertaking Lesson Study*).
Organizing Material for Dissemination

Organizing and making resources available to all instructors that teach the course can enhance the adoption, implementation, and growth of curricular components.

Essential Questions

• How can you share the redesign materials with other instructors?
• How will others know that the resources exist or are updated?

Organize Material

Organize activities, worksheets, assessments, clicker questions, etc., with a structure that permits easy sharing.

Share Resources on the Cloud

Choose an online storage site to host work that can be shared amongst instructors (ie. Google Drive, PB Works, BlackBoard Learn, DropBox). Pick one that works for you and your colleagues.

Send Notification

Encourage instructors to send notifications when new or revised material is added.

Alone we can do so little. Together we can do so much. 
–Hellen Keller
Engaging New Instructors in Your Course-Redesign Project

Expanding your redesigned curriculum and pedagogy to other instructors and those who teach the course in the future is an essential aspect of sustaining your effort and innovation for the benefit of future students.

“Share your knowledge. It is a way to achieve immortality.”
- Dalai Lama XIV

Essential Questions

- How will you inform instructors who were not part of your redesign project about what you did and are doing?
- How will you encourage and support them to adopt your practices and materials and contribute to continuous course improvement?

Explain what you are doing and why

Share your proposal and reports that you generated for STEM Gateway

Make a handbook that outlines the instructional strategies and illustrates their use

(Example handbook prepared by General Chemistry teams available from STEM Gateway)

Share assessment data and involve new instructors in outcomes assessment and student surveys

Make your redesign components accessible for easy adoption and adaptation

Use the cloud (e.g., OneDrive, Dropbox, Google Drive) to share activities, worksheets, assessments, clicker questions, etc., with a structure that permits easy sharing.

(Also see: Organizing Material for Dissemination)
Form a community of practice among instructors to share knowledge in a trusting environment

- Meet informally or formally to discuss challenges to student learning, successful and unsuccessful activities, and to share experiences

(Also see: *Fostering Communities of Practice*)

Undertake *lesson study* – collectively investigate challenging learning outcomes in terms of different ways to teach the concepts

(Also see: *Undertaking Lesson Study*)

Encourage observation in classes that have implemented the redesign

*Much of the knowledge of teaching practice is tacit and is not readily conveyed by text or conversation*

- Invite new instructors to watch you implement the redesign pedagogy and curriculum and to discuss the methods you use.

- Make videos of various practices that anyone can watch at anytime.

Encourage incremental and iterative implementation of unfamiliar approaches

- Avoid unreasonable expectations
- Encourage progressive changes that are comfortable and feasible
- Help new instructors to set goals for changing and assessing their teaching
Involving Graduate Students

Utilize graduate students as soundboards, instructional designers, pilot students, and instruments of feedback when rolling out new or modified curriculum.

**Essential Questions**

- How do you currently utilize graduate students assistants to aid with course redesign?
- What other ways can you utilize the experiences and expertise of graduate student assistants?

Good teachers know how to bring out the best in students.

Charles Kuralt

**Benefit from existing Teaching Assistants**

Many graduate students are responsible for teaching labs. Include them in the process of course design and evaluation. Graduate students can help design new curriculum, review and revise course modules, and provide feedback about course content and pedagogy.

**Prepare Future Faculty**

Involving graduate students in the course design process develops mastery of content and of instructional design, both are needed for effective teaching.
Communicating with Colleagues

Sustaining your redesigned course, improving it, and potentially extending redesign efforts to other courses in your department requires the support of your colleagues.

“And time for reflection with colleagues is for me a lifesaver; it is not just a nice thing to do if you have the time. It is the only way you can survive.”
- Margaret J. Wheatley

Essential Questions

• How will you gain the support of other faculty for your redesign effort?
• How will you generate enthusiasm for other redesign projects in your department?

Tell colleagues what you’ve accomplished

Request time at a departmental meeting to present your project

Share your accomplishments (e.g., new curricula, positive learning outcomes, positive student surveys or teaching evaluations) in email or personal announcements to faculty colleagues

Include your work in alumni newsletters – your colleagues read them, too!

Invite colleagues to experience what you’re doing

Invite colleagues to visit your class and talk about it afterward, soliciting their feedback in addition to elaborating your intentions

Invite colleagues to be guest presenters in your course and assist them to tailor their approach to the format of your course
Talk with your chair to encourage a culture of teaching and learning

Some possible conversation starters from *Faculty Focus*:

“We need to be having more substantive conversations about teaching and learning in our department meetings. What do you think about circulating a short article before some of our meetings and then spending a little time discussing it? Could you recommend some readings?”

“I’m concerned about how we introduce new faculty to teaching in our department. Should our mentoring efforts be more formal? What if we didn’t put student ratings from their first year in their dossier? I would love to hear your thoughts on the ‘ideal’ first-year teaching experience for our new faculty.”

“I’d like us to devise some sort of departmental award or recognition for all kinds of work that supports teaching and learning, and I need your help. Is a monetary award the only option?”

For more teaching-focused conversation ideas from *Faculty Focus* for chairs and faculty, check out: [http://tinyurl.com/deptchairquestions](http://tinyurl.com/deptchairquestions)

---

Identifying a problem is the first step toward making a change

_Fellow redesigners provide a community or network to support and inform your redesign effort_

Recruit redesign projects by asking your colleagues what they are dissatisfied about regarding their teaching, student learning, the degree program, etc.

Ask the department chair to survey faculty to identify consensus concerns about degree curriculum or courses that can motivate making changes.

Use your experience to assist colleagues with their own potentially risky and challenging change process with a focus on resolving their concern or a concern that is shared across the department.

(Also see: *Continuously Improving Teaching and Learning*)
Fostering Communities of Practice

CoPs provide a social platform to solve everyday problems in teaching and student success, develop and disseminate a set of best practices, tools, insights, and approaches needed to excel as teachers and guide students to excel as learner.

Essential Questions

• What is a community of practice?
• How can you foster a CoP?

Taking time to build community, to get to know your people will have long-lasting benefits.- Clifton Taulbert

CoP Key Ingredients

Community- respectful, trusting interactions among the members with the consequence of learning from one another to address the shared interest.

Domain- topic area and sense of identity to affirm the purpose of the community (e.g., instructors of the same course, instructors using a particular technology or pedagogy).

Practice- resources and knowledge that the community develops, finds, shares, and maintains (e.g., pedagogical content knowledge, tools, ideas, assessments, lesson plans)

Starting a CoP

Identify Purpose, Members, Vision, and Goals

Coordinators...

• Identify important issues in the domain
• Plan facilitates community events and manage knowledge
• Manages connections between the CoP and other groups and units
• Assesses the health of the community

CoP Activities

- Meetings to discuss observed challenges to student learning
- Sharing assignments and rubrics
- “Brown Bags” to present ideas or solicit help with a challenge
- Planning presentations and manuscripts
- Discussing item analysis to improve assessments and to examine challenges to student mastery of course outcomes that should be addressed
- Collectively addressing weaknesses in student learning through lesson-study projects
- Classroom observations, focusing on learning by the observer rather than feedback delivered to the observed instructor
Undertaking Lesson Study

Experimental science assumes scale-up occurs by faithfully implementing a proven program in new settings. Improvement science through lesson study assumes scale-up occurs by integrating content knowledge with knowledge about how to build shared ownership of improvement, to detect and learn from variations in practice, to build and share knowledge among practitioners, and to motivate innovation.

“The biggest and most long-lasting reforms of undergraduate education will come when individual faculty or small groups of instructors adopt the view of themselves as reformers, within their immediate sphere of influence, the classes they teach every day.”
- K. Patricia Cross

**Essential Questions**

- Are we achieving the learning outcomes?
- How can we collaboratively improve the outcomes?

**Understand the meaning of lesson study**

**Jugyoukenkuu** (Lesson Study) is the Japanese art of teacher professional development. A group of teachers identify an area of teaching – e.g., topic, concept, instructional method – that needs to be improved or developed. The group then plans the lesson together to address the need. One or more teachers then deliver the new lesson while observed by the others. Learning assessment data is collected and reviewed and areas for further development and improvement are identified.

Lesson study is a collaborative, community-building approach to design and continuous improvement of teaching and learning that can be part of scholarly classroom action research. Having a team effort can help maintain a positive spirit in times of difficulty such as performance gaps. (For more information about lesson study in higher education, go to the Lesson Study Project at the University of Wisconsin-La Crosse, [http://www.uwlax.edu/sotl/lsp/](http://www.uwlax.edu/sotl/lsp/))

**The process of lesson study**

- Identify the desired learning outcomes of the lesson
- Determine through research and experience the instruction that will make learning outcomes visible for observation
- Plan instruction of the lesson
- Teach the lesson and observe students’ response and learning
- Analyze learning outcomes and observations
- Choose new lesson
- Disseminate results (see Connecting Teaching with Research)

**Entry point for initial development**

**Entry point for improvement**
Networking with other team leaders

*STEM students take courses from other instructors who have also been actively redesigning their courses. Talk to team leaders about their experiences, how their redesigns are working, and what alignments may exist in your courses and the ways in which you teach.*

**Essential Questions**
- Who should I talk to about my course redesign project?
- What discussions should I have with other team leaders?

**Reach out to team leaders**

*Biology-*
- Dave Hanson
- Jenn Rudgers
- Kelly Howe

*Earth and Planetary Sciences-*
- Aurora Pun

*Mathematics-*
- Derek Martinez

*Chemistry-*
- Joseph Ho
- Julia Fulghum
- Hua Guo

*Physics--*
- Doug Fields
- Mark Morgan-Tracy

We also encourage you to reach out to other faculty and continue to build your network. By doing so, you can help to build an institutional culture around excellence in teaching.

**Ideas for Discussion**

What components of the redesign worked well for you?
What lessons from the redesign did you learn?
How are you assessing your redesign efforts?
We have been having this problem. Have you?
How did you address it?
How are you engaging your colleagues?
How are your students responding?
What roles do your TAs/GAs play?

If your actions inspire others to dream more, learn more, do more, and become more, you are a leader.

-John Quincy Adams
Organize conversations

Convene regular meetings (especially with nearby CNM and UNM-Valencia County) faculty counterparts to discuss common objectives and challenges and seek common goals and solutions.

Invite reciprocal classroom observations to share tacit knowledge of instructional strategies and techniques.

Example: UNM Chemistry & Chemical Biology Department faculty teaching freshmen and sophomore courses meet twice each year with their CNM counterparts with agendas to address common concerns ranging from textbooks, to pedagogy, to assessment.

Know your counterparts

Contact the branches and CNM to identify the permanent faculty (or frequently employed temporary faculty) who teach your course and introduce yourself and your teaching role at UNM.

Find where values align and highlight your shared vision and mission. Discuss the intersection of institutional missions and your roles in it.

Communicate and share your redesign

Write a summary of your redesign project (purpose, general course design, syllabus, types of instructional materials and assessments) and send it to your counterparts. Ask them to share the same. This synergy will create major benefits and advantages for teachers and students, alike.

Explain how the redesign is intended to better prepare students for subsequent STEM courses at UNM.

Provide samples or full access to your redesign materials in order to stimulate partial or complete adoption at the 2-year campuses.

Essential Questions

- How can we disseminate what we are doing for the benefit of faculty and students at the 2-year campuses?
- How can we learn what our colleagues at 2 year campuses are doing that would benefit our students?

Competition has been shown to be useful up to a certain point and no further, but cooperation, which is the thing we must strive for today, begins where competition leaves off.

- Franklin D. Roosevelt
Connecting Teaching with Research

All teaching should be scholarly ... and when researchers teach, they commonly contribute to the scholarship of teaching and learning, which is a potential source of engagement to sustain your redesign.

"The work of the professor becomes consequential only as it is understood by others. When defined as scholarship ... teaching both educates and entices further scholars"

– Ernest Boyer, Scholarship Reconsidered

Essential Questions

• How can we simultaneously maintain high commitments to both teaching and research?
• How can we disseminate what we are doing for the benefit of others?

Engage in classroom action research

Your classroom/lab/website is a laboratory for observational research – both quantitative and qualitative

Your students and/or artifacts of their learning are the objects of your research

Your course redesign provides your research question and design

Learn more about classroom action research at the Journal of the Scholarship of Teaching and Learning

Consider outcomes assessment as research questions

A stated outcome can be viewed as a hypothesis about student learning that is tested with assessment data

Use a scientific approach to measure learning and connect it to the design of your teaching

Publish and present your research

The scholarship of teaching and learning diversifies your research portfolio

Present at your disciplinary meetings, special conferences, and publish in journals within your discipline or focused on education

Consider presenting at NMHEAR, a local but nationally respected, low-cost, conference where you can disseminate your research and make enlarge your colleague network

Sustaining and Expanding Course Redesign Projects

Notes from the Panel Discussion

Development of an Active Learning Handbook- (The example handbook used in Chemistry can be found in the OneDrive - Sustaining and Expanding Redesign Projects)

The Chemistry 121/122 team developed a handbook for engaging new instructors. The handbook provides a shared language and orientation for new instructors. This reduces the amount of time and repetition needed to engage new instructors. It also can be accessed at any time. It does not cover everything but provides a good starting point. Instructors generally start out with Clickers and move to adopt other approaches in the handbook. New instructors are encouraged to pick a few ideas that they are comfortable using in their teaching. Incremental adoption is encouraged. Pieces of the handbook have been shared with teaching assistants.

(Other ideas for Engaging New Instructors can be found in the Sustainability Handbook p. 6-7 that is located in the OneDrive folder - Sustaining and Expanding Redesign Projects)

Working with Teaching Assistants (TAs)-

Weekly meetings are held with TAs. TAs record how they are teaching (discussion, lecture, clickers, etc.) TAs develop questions in the lesson study format and use it to research deeper into their teaching. They are given 1 week to make a change in approach. Sometimes TAs are not familiar with how to guide learning even after trainings but can make discoveries through the lesson study process in order to improve teaching. Lacking expertise of concepts generally results in providing answers rather than guide students to create their own answer, so training, modeling and, sharing tacit knowledge are needed. Chemistry has created a point system to keep track of the TAs to document occurrences. Keep TAs involved and informed from the beginning. Use an example lab in the lab that can be edited on the go in order to gather TA idea and feedback.

(More ideas for engaging teaching assistants and graduate assistants can be found in the STEM Gateway Sustainability Handbook p.8; for more on Lesson Study see p. 12.)

Classroom Observations

Class observations for the purpose of learning from another, is a critical way to learn tacit knowledge. Instructors can model good teaching practices. Observers should reflect on what the teacher did and why they may be doing it.

(For more information about peer observations see folder 5- Learning from One Another Folder in the One Drive)

Creating a Culture of Teaching in Departments

Success of teaching as departmental activity is dependent upon culture of teaching in the department. It can be frustrating to faculty when the department does not value teaching. The culture of valuing
teaching isn’t attached to a discipline but rather varies among institutions. Focus on getting department chairs engaged and supporting your work. It takes a strong voice, time, and personal relationships to help change culture. (See conversations starters p. 10 of the Sustainability Handbook)

*Staying in touch*

Chemistry holds a weekly meeting to discuss teaching and get people on board. A community of practice framework can provide the platform to engage people. (See Fostering Communities of Practice p. 11 and Engaging New Instructors in the Sustainability Handbook p. 6-7)
ACTIVE LEARNING HANDBOOK

FOR GENERAL CHEMISTRY 121 & 122

**What is Active Learning?**

In the literature, “active learning” is referred to the learning that requires students to cognitively engage and involve in course materials. Research of learning has shown although students can learn by passively receiving information, they learn much better by active engagement. We chose active learning for our general chemistry students to improve their learning of this difficult subject. For our purpose, we use the term “active learning” to describe the collective approach we adopted in our teaching of general chemistry 121 and 122. The philosophy behind this approach is that everything we plan for our students requires them to take an active role in building up their knowledge. For example, students should read the textbook and prepare themselves before each class; during the class, we expect students to engage in problem-solving and learn cooperatively with one another; after the class, we ask our students to continue their engagement of course materials with more ALEKS exercises. All learning strategies we describe in this handbook will not be effective if students are not actively participating. As a teacher, our job is to help and make sure students are actively engaged in these processes.

Faculty needs to be clear about the following Do’s and Don’ts:

**Do’s**

- The learning outcomes for students should be explained to them in the first class;
- How you expect students to do should be explained in the first class;
- You should actively assess and monitor students’ learning progress throughout the semester;
- You should reflect on teaching based on student’s learning progress on the regular basis, and make necessary changes for the better results;
- You should strive for effective communication with our students to increase their motivation and interests in learning the course materials;

**Don’ts**

- Faculty should not view active learning as merely a role switch and a reduction of their preparation for the classes and their role in the classroom teaching.
- Faculty should not implement the active learning strategies blindly without frequently assessing and reflecting on the effectiveness of the strategies.
- Most of the active learning strategies require prompt feedback from faculty; do not delay your responses to students’ questions, muddy points, or misunderstanding.
Misconceptions about learning

1. There isn’t any evidence that active learning is more effective than lecture-based learning.

   Not true. Mounting evidence can be found in the literature. The most recent research article is “Active learning increases student performance in science, engineering, and mathematics” by Freeman et al. From this meta-analysis, on average, student performance on examinations and concept inventories increased by 0.47 SDs under active learning (n = 158 studies), and that the odds ratio for failing was 1.95 under traditional lecturing (n = 67 studies).

2. Learning is more effective and efficient if teacher explains before students try to solve the problem.

   Research has shown this is not true. Students actually learned better when similar problem was presented to them before teacher explained the underlying principles. We learn better when we wrestle with new problems before being shown the solution, rather than the other way around.

3. A mass learning is more effective than spaced learning.

   From many research, it is indicated that spaced or distributed learning can have long-term learning effect than a short-term and intense learning. Therefore, it is recommended to divide student study time for different subjects and avoid procrastination. It is also important to revisit previous concepts periodically in our teaching.

4. It is always a good advice to students that reading and re-reading textbook or lecture note is important in an effective, long-term learning. Repetitive exposure builds memory.

   Research in neuroscience about learning has provided evidence that re-reading is not an effective learning method. Repeated reading provides the illusion of mastery of the underlying ideas. The fact that you can repeat the phrases in a text or your lecture notes is no indication that you understand the significance of the precepts they describe, their application, or how they relate to what you already know about the subject.

   Among other methods we commonly used, highlighting, marking and summarization are also not effective for learning. Practice testing and self-explanation are more effective than the above methods.

5. Student’s motivation to learn in our classes is low. It is important to make our class fun and interesting. It is also important to avoid asking students to do difficult tasks and causing them frustration.

   Some kinds of difficulties during learning help to make the learning stronger and better remembered. When learning is easy, it is often superficial and soon forgotten. Not all of our intellectual abilities are hardwired. In fact, when learning is effortful, it changes the brain, making new connections and increasing intellectual ability.
To achieve excellence in any sphere, you must strive to surpass your current level of ability. Striving, by its nature, often results in setbacks, and setbacks are often what provide the essential information needed to adjust strategies to achieve mastery.

6. **Fluking an exam is bad.**

Flunking exams is actually a good thing, from cognitive psychology. “Across a variety of experiments, psychologists have found that, in some circumstances, wrong answers on a pretest aren’t merely useless guesses. Rather, the attempts themselves change how we think about and store the information contained in the questions. On some kinds of tests, particularly multiple-choice, we benefit from answering incorrectly by, in effect, priming our brain for what’s coming later. That is: The (bombed) pretest drives home the information in a way that studying as usual does not. We fail, but we fail forward.” This is the message from Benedict Carey in his NY Time article.
Planning for your course

The most common approach faculty takes to design a general chemistry course is a content-based approach. In this approach professors first determine the order of topics – this is usually based on textbook chapters with some modifications according to teacher’s experience. Once the order is determined, a class schedule will be planned to fit topics into the weekly lecture meetings. At this point, the course design is almost done and the professor just needs to insert a couple of midterm exams and a final exam to finalize the class schedule. The whole process can be finished within a day, or even a couple of hours for an experienced faculty.

Although this approach is quick and easy, and it allows faculty to makes sure all the required topics will be covered in the course, there are many important aspects about student learning that have not been considered in this approach. For example, is there evidence that shows the planned learning method is effective for student learning? What are the students learning outcomes from this course? What is the mechanism that allows the instructor to improve student learning during the semester? These questions are especially important in a class with diverse student background like in our general chemistry classes that we do not know and should be considered in our course design process.

The approach we recommend and describe in this handbook is called the backward design. We call it backward design because we start with the final outcomes we expect our students to reach as the result of the course learning, and go “backward” to work out the best strategies for students to accomplish the final outcomes. This approach focuses on how “students” reach the “learning outcomes”, instead of how “professor” teaches the “covered topics”.

Before we begin to introduce the steps of backward design, we explain the terminology we use.

1. Each UNM core course has a set of course level Student Learning Outcomes (SLOs). You can find the SLOs for CHEM 121 and 122 in Appendix A. You need to adopt these SLOs for your course. Each semester, you should collect assessment data against selected SLOs (two to three) and use it for the writing of annual General Education Assessment reports.

2. Based on course SLOs, you can write a set of Instructional Objectives (IOs) as the course content. For example, for SLO#3 of CHEM 121: “Explain the structure of the atoms, isotopes and ions in terms of its subatomic particles”, you might have the following three IOs: (1) students practice to identify the numbers of subatomic particles for different elements in the periodic table. (2) students practice to identify isotopes and the numbers of subatomic particles. (3) students practice to identify ions and the numbers of subatomic particles.

3. When we prepare the course level IOs, we need to consider different cognitive and affective levels of student learning activities as described in Bloom’s and Fink’s Taxonomies. Both taxonomies are explained in Appendix B.

4. To monitor students’ learning progress throughout the semester, we use both informative and summative assessments. The informative assessments are low-stakes assessment focusing on providing a quick and diagnostic measure of student understanding and the effectiveness of
teaching. The **summative assessments** are high-stakes assessments serving for the purpose of grading and reporting.

We recommend the following steps for your planning of this course:

1. What are the IOs to be covered are determined which are aligned with course SLOs
2. Learning strategies are chosen & designed for students to learn topics planned in IOs
3. How will IOs and SLOs be assessed during and by the end of semester?
4. What are the course activities to be developed and implemented?

We divide our course activities into three categories based on when it happens:

<table>
<thead>
<tr>
<th>Category</th>
<th>activities</th>
<th>goals</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pre-class</strong></td>
<td>Reading assignments</td>
<td>Students learn facts from reading; we expect them to understand simple concepts, too.</td>
</tr>
<tr>
<td></td>
<td>Reading quizzes</td>
<td>Quick assessment of students’ reading</td>
</tr>
<tr>
<td></td>
<td>Muddy points</td>
<td>Students reflect on their reading and inform teachers about what is not understood.</td>
</tr>
<tr>
<td><strong>In-class</strong></td>
<td>Introduction &amp; responses</td>
<td>Teacher summarizes covered topics and responds to students questions</td>
</tr>
<tr>
<td></td>
<td>I-clicker questions</td>
<td>Assessments of student’s learning</td>
</tr>
<tr>
<td></td>
<td>Small group discussions</td>
<td>Students learn covered topics by cooperatively solving problems</td>
</tr>
<tr>
<td><strong>Post-class</strong></td>
<td>ALEKS exercises</td>
<td>Requiring students to transfer knowledge from short-term memory to long-term memory by retrieving and applying.</td>
</tr>
</tbody>
</table>

Under the framework presented above, you can start to plan for your implementation. The following questions help you form your policy and what to be prepared.

**Pre-class**

1. How do I let students know the reading assignments? Should I use handouts, e-mails, or announcement in the BlackBoard Learn?
2. Do I want to ask students to read just the textbook in the reading assignments, or do I want to add other materials such as simulation, videos, or handouts?
3. How will I do the reading quizzes? Will I use ALEKS questions, or my own questions delivered on BlackBoard LEARN? Or will I give them a quiz in the beginning of each class as the reading quiz?
4. How will I assign and collect answers from muddy points? Keep in mind the purpose of muddy points is to inform you about students’ pre-class reading, and should be collected
before the class. You should have sufficient time to review students’ responses before each class. In our current practice, we use LEARN to collect and review responses.

5. What percentage of grade you will give to the pre-class quizzes and muddy points?
6. What are the source or resources of reading assignments? Is there existing resource from course redesign?

**In-class**

1. How will I organize and present the topics I planned to discuss in each class? Should I use PowerPoint slides as the outline for the classes? Should I give mini-lectures to summarize and further explain the concepts or misconceptions indicated by students’ responses?
2. How will I conduct the small group discussions? How will I form groups? How will I make sure each student has a role in the group discussion? How will I credit each student for discussions? How will help group discussion if they have questions? How will I oversee more than one group? How will I organize PLF and TAs to facilitate the discussions?
3. How will I use clicker in the class? What proportion of grade will I give to students for the use of clickers? What is my policy regarding loaning clickers? How will I register students for clicker? (the section of Classroom Technology has more recommendations)

**Post-class**

1. How will I grade ALEKS? How will I set up ALEKS, objective or open-pie? Do I want periodic assessments? How frequently do I want assessments?
2. Do I want to give students post-class projects or assignments in addition to ALEKS? How will I grade these assignments?

**Other Course Policies**

1. Will I take attendance? Will attendance be required and counted toward the final grade?
2. This course has the lab (CHEM 123L or 124L) as the co-requisite. If a student has previously passed the lab, they can register this course without the lab. You need to be aware of this curricular rule when students ask you to give them an override for co-requisite. Similar problems also arise when students drop one of these co-requisite courses because they will also be dropped from the other course. The general rule is the faculty for the course student will remain in made the decision for whether an override will be granted. For example, if a student wants to drop the lab and remain in the lecture, they should appeal to the lecture faculty for override. However, when making the decision, you should consider for the integrity of the curriculum and whether it is possible for student to pass the course. For example, if student wants to drop the lab in week 1 and remains in the lecture, you need to make sure the student’s intention is not to take the lecture without the lab. You also need to make sure that student understands by taking the lecture alone, he/she cannot take the next course until he/she pass the lab, which will delay their progress. The lab policy is students can stay in the lab when they drop from the lecture only if they have completed
50% of the lab materials and with a passing grade. You can consider a similar rule for your class.

3. You should have a classroom policy in place. For example, will you allow students to use cell phone or surf the internet in class?

4. You should have the date and time and room number for your office hours posted.

5. You should have an e-mail policy in place. For example, will you answer weekend e-mails? In what timeframe will students expect to receive your responses?

6. You should have the grading policy in place.
Learning Strategies Inventory

Muddiest (or Clearest) Point. This variation on the one-minute paper is specifically designed for determining gaps in student comprehension (Angelo & Cross, 1993). The instructor requests a one-minute written response to the question “What was the ‘muddiest point’ in today’s lecture?” or “What concept do you find most difficult to comprehend?” The question may be more specific. Because the instructor collects the responses immediately and can read them before the next lecture period, he or she has the opportunity to make teaching adjustments in response to the students’ needs much sooner than would be possible otherwise.

One-Minute Paper. Originally reported by Angelo and Cross (1993), this technique has been adapted for use in virtually every discipline (see, for example, Dorroh, 1993; Fishman, 1997; Kloss, 1993; Ludwig, 1995; Morrissey, 1982). It is a highly effective method for checking student progress and for providing a consistent means of communicating with students. To implement this method, the instructor simply stops class a few minutes early (or pauses at some point during a lecture), poses a specific question (for example, “What was the main point presented in today’s class material?”), and gives students one (or perhaps two—but not many more) minute to respond. Students’ responses tell the instructor whether or not they view the material in the way he or she envisioned.

Depending on an instructor’s objectives, students may submit their responses anonymously or with their names on them. Anonymity may encourage otherwise reticent students to voice concerns or raise questions, but it will not foster direct communication between students and the instructor. Further, it has been argued that allowing anonymous submissions actually detracts from active engagement in the exercise because students may perceive that they have little to gain by applying themselves to the task (Harwood, 1996).

Reading Quiz. Active learning depends on students coming to class prepared. In addition to being an effective means of encouraging students to read assigned material, the reading quiz can be used to measure student comprehension of readings, thus providing the instructor with evidence of students’ level of sophistication as readers (Mazur, 1996, 1997). By asking the same sorts of questions on several reading quizzes, instructors can guide students regarding what to look for when reading assigned texts. For instance, if reading quizzes in an English literature class consistently include questions such as “What color were Esmerelda’s eyes?” students will learn that it is the details that count. On the other hand, questions such as “What reason did Esmerelda give for murdering Sebastian?” highlight issues of justification. If the goal is to instruct and not merely to coerce, quiz questions must be carefully constructed so that they identify both which students have read the material (for the instructor’s benefit) and what is important in the reading (for the students’ benefit). Using straightforward questions based directly on the class reading assignments for each day, Paulson (1999) has found a correlation ($r = \sim 0.8$) between the total points on the reading quizzes and the total course points.
Pair-share. Putting students in pairs provides many of the advantages of group work. A recent meta-analysis of 383 published reports on small-group learning in college science, math, engineering, and technology classes showed that small-group learning promotes greater student achievement, increases retention in courses, and promotes favorable attitudes toward the course material (Springer, Stanne & Donovan, 1998). Students have the opportunity to state their own views, to hear from others, to hone their argumentative skills, and so forth, without the administrative requirements of group work (time spent assigning people to groups, class time used for getting into groups, and so on) (Shakarian, 1995). Further, working in pairs makes it virtually impossible for students to avoid participating, thus making each person accountable.

**Pair Discussion.** In discussion, students pair off and respond to a question either in turn or as a pair. This method easily can be combined with other techniques, such as those discussed under “Questions and Answers” or the “Critical-Thinking Motivators” discussed above. For example, after students have responded to a list of true-false statements, they can be asked to compare their answers with their partner’s and to discuss the statements on which they differed. In science classes, students can be asked to explain how some experimental data support a theory that the instructor has just discussed. Generally, this approach works best when students are given explicit directions, such as “Tell each other why you chose the answer you did.”

**Note Comparison/Sharing.** One reason that some students perform poorly in classes is that they do not have good note-taking skills. That is, although students may listen attentively, they do not always know what to write down, or they may have gaps in their notes that leave the bewildered when they go back to the notes to study or write a paper. One way to avoid some of these pitfalls and to have students model good note taking for each other is to have them compare notes occasionally. After covering a crucial concept, the instructor might stop lecturing and have students read each other’s notes, filling in the gaps in their own note taking. This activity is especially useful in introductory courses or in courses designed for non-majors or special admissions students. When students see the value of supplementing their own note taking with others’ notes, they are more likely to continue the practice outside of class time.

**Peer Review.** This method works well when students have completed an individual homework assignment or short paper. On the day the assignment is due, students submit one copy to the instructor and one copy to a partner. Partner pairs may be formed just for the day or assigned for the entire term. Each student offers critical feedback on his or her partner’s work,
standardizes or assesses the partner’s arguments, or corrects mistakes in problem solving or grammatical accuracy. Peer evaluation can be a particularly effective way to improve student writing. However, students need to be given specific instructions on what to look for in the work they are assessing. In a course that Paulson teaches entitled Writing for Chemists, for example, students receive a Group Editing Guide, which helps them to focus on the important features in each section of a paper. Without these detailed instructions, students tend to make rather general and not very useful comments. Students also can benefit from assessing an anonymous paper or a paper from a previous class selected by the instructor.

**Jigsaw Group.** In jigsaw projects, each member of a cooperative-learning group becomes “specialized,” mastering a discrete part of the subject matter required to complete the project. He or she thereby possesses knowledge critical to the rest of the group. There are generally four stages in the jigsaw process (Clarke, 1994; Marcus, 1998). First, the instructor organizes students into heterogeneous home groups (if the instructor has assigned students to base groups during the term, the base group may constitute the home group for a given project). Each member of the home group is assigned or chooses a part of the subject matter to be explored. For example, if the project requires applying several moral theories to a case study, each student in the home group is assigned to become an expert on a particular moral theory. In the second stage, students reform into focus groups centered on their selected topics. In our hypothetical example, several students from different home groups who were designated as experts on Kant’s moral theory would group together to explore, clarify, and write down the main ideas of that theory. In the third stage, these focus groups disband, and the original groups re-form. The home groups now include an “expert” on each moral theory sub-topic. The experts report their findings to the rest of their home group, and the group discusses the issues in depth. The fourth and final stage of the project requires the group to apply this information. In the example above, each group could determine the moral status of an action portrayed in a case study according to the various moral theories they have mastered.

**Active-Review Sessions.** In the traditional class review session, the students ask questions and the instructor answers them. Students spend their time copying down answers rather than thinking about the material. In an active-review session, the instructor poses questions, and the students work on them in cooperative-learning groups (either informal or base groups can serve this purpose). Then the instructor asks students to share their solutions with the class, and all students discuss any differences among their proposed answers. The ensuing discussion can be guided according to the questions and answers techniques outlined above.

**Work at the Blackboard.** In many problem-solving courses (such as mathematics, logic, or critical thinking), instructors tend to review homework or teach problem-solving techniques by solving the problems themselves. Because students learn more by doing than watching
(Springer et al., 1998), this is clearly not the optimal scenario. Rather than illustrating problem solving, instructors can have students work out the problems themselves by asking them to go to the blackboard in small groups. Cooperative groups encourage discussion of problem-solving techniques (“Should we try this?”) without embarrassing students who have not yet mastered the required skills. If there is insufficient blackboard space, students can still work out problems as a group by using paper and pencil, small dry-erase boards, or even computers if the appropriate software is available.

**Concept Mapping.** A concept map is a way of illustrating the connections that exist between terms or concepts covered in class (Novak, 1990; Novak & Gowin, 1984). Students brainstorm to generate a list of facts, ideas, or concepts for a particular topic and then draw lines connecting related items. Above each line students write the nature of the relationship between the items. Because most of the terms in a concept map have multiple connections, students must identify and organize information to establish meaningful relationships between the pieces of information. A concept map is an effective means to show students how the many concepts covered in a typical course are connected. Although individuals as well as groups of students can do concept mapping, the maps produced in groups are usually much more detailed than those produced by individual students.

**Visual Lists.** In this technique, students make a list of opposing points or arguments on paper or on the blackboard. Students typically can generate more comprehensive lists working in groups than they can alone. This method is particularly effective when asking students to compare views or to list the pros and cons of a position. One technique that works well with such comparisons is to have students draw a “T” and label the left- and right-hand sides of the crossbar with the opposing positions (or “Pro” and “Con”). Students then list everything they can think of to support these positions on the relevant side of the vertical line. Once students have generated as thorough a list as they can, the instructor asks them to analyze the lists by asking questions that are appropriate to the exercise.

**Peer-led Team Learning**

The Peer-Led Team Learning (PLTL) Workshops generally supplement the lecture. PLTL [http://www.sci.ccny.cuny.edu/~chemwksp/](http://www.sci.ccny.cuny.edu/~chemwksp/) can be used in a course with any size enrollment. Under the PLTL model, undergraduate students who have done well in the class previously are recruited and trained as workshop leaders or peer leaders who guide the efforts of a group of six to eight students. These peer-led groups meet weekly (separate from the lecture and the instructor) to work together on problems that are carefully structured to help the students build conceptual understanding and problem-solving skills. There are no answer keys for either the students or the peer-
leaders; the emphasis is on learning to find, evaluate, and build confidence in answers. Simultaneously, the workshops and the peer leaders provide a supportive environment that helps each student participate actively in the process of learning science. Thus, PLTL offers a mix of active-learning opportunities for students and a new role for undergraduate peer leaders that is appropriate for their stage of development; PLTL has been used successfully in courses in chemistry, biology, physics, math, computer science, and engineering. In practice, the weekly workshop replaces traditional recitation sections led by graduate teaching assistants or faculty. Although most peer leaders are undergraduates, many graduate students with appropriate training have also worked effectively and enthusiastically in that role.
Classroom Technology

Blackboard LEARN class management

The BlackBoard LEARN server is maintained by Extended University and UNM IT department. To acquire an account of your course, you need to

1. Go to http://my.unm.edu and login with your UNM Netid and password. Then you go to Loboweb under Faculty Life tab.
2. Look for Web Enhanced Courses in the menu. Click on the link.
3. Select your course by checking the box next to the course name.
4. Press the Submit button (Before you do, make sure you are certain this is what you want. Once a course becomes web-enhanced, you cannot un-do it.)
5. Now you can go to http://learn.unm.edu and login with your netid and password. You should be able to see your course listed.
6. You need to set up your LEARN course in order to use it. You can also copy another course’s content to this one. Please be referred to the tutorial for BlackBoard under UNM LEARN website.

i-click classroom response system

You will need to (1) contact UNM Bookstore to request enough number of i-clicker to be stocked for students to purchase. (2) contact UNM Media Services to obtain an i-clicker receiver.

You can find a tutorial from i-clicker website. Basically, the following should be completed before your first class:

1. Obtain a copy of i-clicker software from http://iclicker.com
2. Download a class list from loboweb and convert it to the correct format for i-clicker use.
3. Determine the method of student registration as one of the three options: (1) online registration (2) on-call registration (3) manual registration by instructor.
4. Set up the configuration of i-clicker for your course.
5. Set up i-grader to manage the usage of iclicker by students
6. Write i-clicker questions

ALEKS adaptive learning program

1. You can contact Joe Ho (khoj@unm.edu) to get an account under UNM group account.
2. You will receive an e-mail and follow the instruction from the e-mail to complete the setup of ALEKS account.
3. You are now ready to set up your ALEKS course. Refer to Appendix for tutorial.
Assessments of student learning

There are two types of assessments: informative and summative assessments.

**Informative assessments**

An informative assessment is not for grading purposes. Instead, we use informative assessments to monitor the progress of student’s learning. An informative assessment can be used by teachers as a diagnostic tool for the effectiveness of their teaching. When designed properly, an informative assessment can reveal student’s misconception and provide direction for both students and teacher how to correct the misconception. It is therefore an important instrument for students’ metacognition.

Although informative assessment is not for grading, a small credit is usually given to students to encourage them to take the assessments. It is low-stake so that students are not afraid of participating. It should be presented as an opportunity for them to quickly check on their understanding of the subject. For example, a clicker question is usually given right after a concept is discussed, and they will receive a credit not based on the correctness of their answers. Under such setting, students will not be afraid of losing the credit due to a wrong answer, and focus completely on learning the topic. Students should give an honest answer according to their understanding.

In this course, we have four basic informative assessments: pre- and post-concept inventory tests, reading quizzes, clicker questions, and common core questions in the mid-term exams. We will explain these assessments.

**Summative assessments**

The summative assessments are exams and quizzes we normally use. They are for the purpose of evaluating student’s comprehensive understanding of the materials and their ability to apply the materials. They are important part of the course final grade.

We have two summative assessments in this course: midterm exams and common final exam.

**Pre- and post-concept inventory tests**

The concept inventory tests we use are originated from the Concept Inventory test published by Purdue University (citing reference) and modified by UNM faculty to provide more complete coverage of topics our general chemistry covers. The same tests have been administered in the co-requisite lab (CHEM 123L and 124L) since 2012, as the pre- and post-tests. The performance gains from the pre- to the post-test are one of the independent measures for student learning from the course.

**Reading quizzes**

The reading quizzes serves for three purposes (1) for students to evaluate their understanding of the reading assignments (2) for teacher to obtain a general perspective of student’s understanding of the
reading assignments, and (3) to motivate students to complete the reading assignments. It is therefore, crucial for the effectiveness of pre-class learning. Each quiz should not be long, but specific enough to provide an insight of students’ reading. It is common to have three questions in each quiz so that students only need to spend 5 minutes to answer. The questions we should avoid are those answers can be found from the reading text directly. It is the best to ask conceptual questions that require understanding of the text read. One should also avoid asking very long calculations in the reading quizzes. However, sometimes it is desirable to know whether students have paid attention to the steps of calculation explained in the text.

The reading quizzes are conveniently delivered online. The possible platforms for delivery these quizzes are LEARN website, or ALEKS assignments. You can write your own questions using LAERN test and have the quizzes graded automatically. You can view the results and basic statistics from LEARN. If you want to use paper quiz as in the beginning of each class, you need to make sure you have the enough manpower (TA and PLF) for grading them.

The statistics from each reading quiz can provide important information about your students’ preparedness of the class. You should review the result of each reading quiz and use it in your preparation of next class. For example, you should add the topics that most of your students does not understanding as indicated by the quiz result to your lesson plan.

**Clicker questions**

Clicker questions can be used for many different purposes. You can use clicker questions as the reading quizzes, taking attendance, checking on students’ learning progress, for peer learning, and surveys.

**Reading quizzes**: it is usually administered in the very beginning of a class and obtain a quick assessment of student’s preparation.

**Taking Attendance**: you can use the answers of selected questions throughout the class to check for attendance.

**Learning progress**: questions can be given after the completing of an activity, such as a lecture of a specific topic, and the statistics of students’ answer can provide a quick assessment of student learning.

**Peer learning**: It is usually done with a clicker question first and if many students did not answer it correctly, have students explain to other group members or their neighbors the reason for their answers. We expect students will learn from other student’s explanation about the concept during this discussion. Then a similar question will be administered after the discussion to evaluate student learning again. This process can repeat until a satisfactory portion of students have learned the concept indicating by the repeated clicker questions.
**Common core questions for midterm exams**

We agree to implement common core questions for each midterm exam decided by all faculty members teaching general chemistry. These questions will help us check on the progress of learning about key concepts across sections. These common questions will also provide data for general course assessment required by the University and State of New Mexico.

**Midterm exams**

There will be four midterm exams administered each semester for grading. Faculty members should coordinate for the date of each exam so that all sections will have the exam date during the same week.

**Common final exam**

The common final exam will be written by faculty who is not teaching the general chemistry course. All sections will take the same exam, which can have multiple versions, to provide standard assessments of student comprehensive learning from the course. The exam will be written for the SLOs of the course and all midterm exams can be used as references of the questions to be included. Questions on the final exams are expected to have the similar style as the questions of the midterm exams from all sections. Topics which is not taught by any section should not be included. Faculty from each section is responsible to communicate with the exam writer about the topics which are not covered during the semester.
Lesson Study

What is Lesson Study and Why is it recommended?

Lesson study is a practice of teachers to improve student learning through a research of student learning problem they observe. This practice directly targets learning problems in the course, finds solutions in the timely manner and optimizes the implementation. Therefore, Lesson Study can be very effective in providing immediate improvement of student learning and optimize active learning strategies each faculty member employs in their teaching. Through LS group discussions, supports from other members’ suggestions are valuable resources of professional developments of the teachers.

How to practice Lesson Study?

In Lesson Study, teachers can start with any steps presented in the above cycle. The most common first step of a lesson study is defining a research question. Teaching observation is a logical source of finding learning problem to be defined as a research question. Therefore, starting your lesson study with teaching observation is recommended.
Management of Peer Learning Facilitators (PLF)

Pre-semester Training

The pre-semester training is given during the week before the semester starts, which should include the following topics

- Principles of Active Learning & cooperative learning
- Practice of Classroom Discussion
- Reflection on the classroom practice
- Your expectation

In-semester Training

You are expected to meet with your PLF at least once a week to go over the following topics:

- Weekly Learning Issues
- Weekly discussion of course topics to be covered
- Discussion of weekly worksheets & answers
- Weekly evaluation of PLF performance

Evaluation

The performance of PLF should come from the following evaluations conducted throughout and by the end of a semester and be used as the basis for the future hiring:

- Student evaluation
- Peer evaluation
- Faculty evaluation
Appendix A  Course Level Student Learning Outcomes (SLOs)

Students finishing CHEM 121 should be able to

1. Relate the development of essential chemical theories to the application of the scientific method. (Related to HED Core Competencies Area III no. 1)
2. Use dimensional analysis, the SI system of units and appropriate significant figures to express quantities, convert units and perform quantitative calculations in science. (Related to HED Core Competencies Area III no. 2 and 5)
3. Explain the structure of the atoms, isotopes and ions in terms of its subatomic particles. (Related to HED Core Competencies Area III no. 1 and 2)
4. Use the IUPAC system of nomenclature and knowledge of reaction types to describe chemical changes, predict products and represent the process as a balanced equation. (Related to HED Core Competencies Area III no. 4)
5. Describe physical states and changes, and distinguish these from chemical changes. (Related to HED Core Competencies Area III no. 4)
6. Apply the mole concept to amounts on a macroscopic and a microscopic level and use this to perform stoichiometric calculations including for reactions in solution, gases and thermochemistry. (Related to HED Core Competencies Area III no. 2 and 4)
7. Apply the gas laws and kinetic molecular theory to relate atomic level behavior to macroscopic properties. (Related to HED Core Competencies Area III no. 2 and 4)
8. Describe the energy conversions that occur in chemical reactions, relating heat of reaction to thermodynamic properties such as enthalpy and internal energy; calculate and describe how to measure energy changes in reaction. (Related to HED Core Competencies Area III no. 4 and 5)
9. Use different bonding models to describe formation of compounds (ionic and covalent). Apply knowledge of electronic structure to determine molecular spatial arrangement and polarity. (Related to HED Core Competencies Area III no. 4)
10. Analyze how periodic properties (e.g. electronegativity, atomic and ionic radii, ionization energy, electron affinity, metallic character) and reactivity of elements results from electron configurations of atoms. (Related to HED Core Competencies Area III no. 4)
11. Apply principles of general chemistry to specific real world problems in environment, engineering and health-related fields. (Related to HED Core Competencies Area III no. 4 and Area II no. 2)
Students finishing CHEM 122 should be able to

1. Explain the intermolecular attractive forces that determine physical properties and phase transitions; apply this knowledge to qualitatively evaluate these forces from structure and to predict the physical properties that result. (Related to HED Core Competencies Area III no. 2)

2. Calculate solution concentrations in various units (molarity, molality, mole fraction, % by mass, and % m/v) and explain the effects of temperature, pressure and structure on solubility. (Related to HED Core Competencies Area III no. 2)

3. Describe the colligative properties of solutions and explain them using intermolecular forces. Determine solution concentrations using colligative property values and vice versa. (Related to HED Core Competencies Area III no. 2 and 4)

4. Explain reaction rates, rate laws, and half-life; determine the rate, rate law and rate constant of a reaction and calculate concentration as a function of time and vice versa. (Related to HED Core Competencies Area III nos. 2 and 4 and Area II nos. 1 and 2)

5. Explain the collision model of reaction dynamics, including activation energy, catalysts and temperature; derive a rate law from a reaction mechanism and evaluate the consistency of a mechanism with a given rate law. (Related to HED Core Competencies Area III no. 2 and 4)

6. Describe the dynamic nature of chemical equilibrium and its relation to reaction rates; apply Le Chatelier’s Principle to predict the effect of concentration, pressure and temperature changes on equilibrium mixtures. (Related to HED Core Competencies Area III no. 2)

7. Describe the equilibrium constant and use it to determine whether equilibrium has been established; calculate equilibrium constants from equilibrium concentrations and vice versa. (Related to HED Core Competencies Area III no. 2 and 4 and Area II no. 2)

8. Describe the different models of acids and base behavior, and the molecular basis for acid strength. (Related to HED Core Competencies Area III no. 2)

9. Apply equilibrium principles to aqueous solutions, including acid-base and solubility reactions; calculate pH and species concentrations in buffered and unbuffered solutions. (Related to HED Core Competencies Area III no. 2 and 4 and Area II no. 2)

10. Explain titration curves and speciation diagrams; calculate concentrations of reactants from the former and determine dominant species as a function of pH from the latter. (Related to HED Core Competencies Area III no. 2 and 4 and Area II nos. 1 and 2)

11. Explain and calculate the thermodynamic functions enthalpy, entropy and Gibbs free energy for a chemical system; relate these to equilibrium constants and reaction spontaneity. (Related to HED Core Competencies Area III no. 2 and 4)
12. Balance redox equations, express them as two half reactions and evaluate the potential, free energy and equilibrium K for the reaction, as well as predict the spontaneous direction. (Related to HED Core Competencies Area III no. 2 and 4)

13. Construct a galvanic or electrolytic cell; determine the standard (and non-standard) cell-potential of the former and relate current to electron transfer rates in the latter. (Related to HED Core Competencies Area III no. 2 and 4).
Appendix B  Sample Course Level Instructional Objectives (IOs)

CHEM 122

1. Explain the intermolecular attractive forces that determine physical properties and phase transitions; apply this knowledge to qualitatively evaluate these forces from structure and to predict the physical properties that result. (Related to HED Core Competencies Area III no. 2)

1. Intermolecular forces- origin and relative strength
2. Intermolecular forces- relationship with molecular size, shape and strength
3. Intermolecular forces- relative strength of surface tension, viscosity, phase cohesion
4. Changes of state- States of matter and molecular processes
5. Changes of state- Heating curves and the enthalpy of transition
6. Changes of state- Clausius-Clapeyron equation and graph
7. Changes of state- Supercritical fluids and the critical point
8. Changes of state- Phase diagrams, key features and phase changes
9. Changes of state- Unique properties of water
10. Solids- Types of solid states and their relative properties
11. Solids- Unit cells and basic structures: calculation
12. Solids- Determination of geometry using X-ray diffraction
13. Solids- Band-gap theory and application in semi-conductors

2. Calculate solution concentrations in various units (molarity, molality, mole fraction, % by mass, and % m/v) and explain the effects of temperature, pressure and structure on solubility. (Related to HED Core Competencies Area III no. 2)

14. Solutions- solutes, solvents and their interactions
15. Solutions- the entropy and enthalpy of dissolution
16. Solutions- effects of structure on solubility (intermolecular forces)
17. Solutions- effects of temperature and pressure on solubility
18. Solutions- units of concentration, including molarity, molality, mass percent and mole fraction

3. Describe the colligative properties of solutions and explain them using intermolecular forces. Determine solution concentrations using colligative property values and vice versa. (Related to HED Core Competencies Area III no. 2 and 4)

19. Colligative properties- their physical basis for molecules and ions
20. Colligative properties- vapor pressure reduction and Raoult’s law (and deviations)
21. Colligative properties- BP elevation and FP depression are not contradictory
22. Colligative properties- Osmotic pressure and its calculation and measurement
23. Colligative properties- Isotonic solutions and reverse osmosis
24. Colligative properties- the Van’t Hoff factor for ionic solutes

4. Explain reaction rates, rate laws, and half-life; determine the rate, rate law and rate constant of a reaction and calculate concentration as a function of time and vice versa. (Related to HED Core Competencies Area III nos. 2 and 4 and Area II nos. 1 and 2)

25. Differential rate laws - reaction order determination
26. Integrated rate laws - half time determination
27. Integrated rate Laws - graphing concentration vs time
5. Explain the collision model of reaction dynamics, including activation energy, catalysts and temperature; derive a rate law from a reaction mechanism and evaluate the consistency of a mechanism with a given rate law. (Related to HED Core Competencies Area III no. 2 and 4)

28. Arrhenius equation - effect of temperature and catalyst
29. Collision model - orientation factor and collision frequency
30. Reaction mechanism - elementary steps and their rate expressions
31. Reaction mechanism - overall reaction rate law from a proposed mechanism

6. Describe the dynamic nature of chemical equilibrium and its relation to reaction rates; apply Le Chatelier’s Principle to predict the effect of concentration, pressure and temperature changes on equilibrium mixtures. (Related to HED Core Competencies Area III no. 2)

32. Chemical equilibrium arises in cases of reversible reaction kinetics, both forward and reverse reactions occur.
33. A system is said to have reached (attained) equilibrium when the rate of the forward reaction \( R_{\text{forward}} \) is equal to the rate of the reverse reaction \( R_{\text{reverse}} \) so no net change in reactant concentrations occurs.
34. Chemical equilibrium on a microscopic level is dynamic, not static; reactants are constantly being converted into products and vice versa.
35. Chemical equilibrium on a macroscopic level is stable: regardless of initial state, concentrations change to produce a specific ratio of reactants to products.
36. Chemical equilibrium represents an incomplete reaction- both reactants and products are present, although some concentrations may be very low.
37. LeChatelier’s principle- an equilibrium system which experience a perturbation in concentration, pressure or temperature responds in such a way as to minimize the size of the perturbation
38. You should be able to
   a. Predict the effects of changing concentrations, pressure or temperature on the composition of an equilibrium system
   b. Explain these changes using LeChatelier’s principle

7. Describe the equilibrium constant and use it to determine whether equilibrium has been established; calculate equilibrium constants from equilibrium concentrations and vice versa. (Related to HED Core Competencies Area III no. 2 and 4 and Area II no. 2)

39. The equilibrium constant \( K \) is the quantitative expression of equilibrium.
40. At equilibrium, \( K \) equals the ratio of product concentrations to reactant concentrations (to the powers of their respective coefficients)
   a. The concentrations of pure solid phases and liquid solvents are considered to equal 1.
   b. \( K_p \) for gas-phase reactions is the ratio of product pressures to reactant pressures (to the powers of their respective coefficients)
41. If a reaction is combined or changed, the \( K \) value changes:
   a. Reversing a reaction gives \( K_{\text{rev}} = \frac{1}{K_{\text{for}}} \)
   b. If a reaction is multiplied by a constant, the \( K \) for that reaction should be raised to the power of that constant.
   c. If two reactions are added, the combined reaction \( K \) is the quotient of the two reaction \( K \)s
   d. If a reaction B is subtracted from reaction A, \( K_{\text{comb}} = K_A / K_B \)
42. Large \( K \) values imply a product-favored reaction, and small \( K \) values a reactant-favored one (assuming 1:1 overall mole ratios between reactant and product)
43. The equilibrium constant for an elementary (a step within an overall) reaction is the ratio of the forward rate constant to the backward rate constant
44. The reaction quotient $Q$ equals the ratio of product concentrations to reactant concentrations (to the powers of their respective coefficients) under actual conditions (not just at equilibrium).
45. Utilize the ICE methodology for solving equilibrium problems.
46. Apply the typical assumptions and approximations for solving equilibrium problems and explain why they work.
47. Write equilibrium constant expressions from overall chemical equations for both solution species and gases, and mixtures of the two.
48. Calculate $K$ for a reaction from equilibrium concentrations (or pressures).
49. Calculate $K$ if a reaction is reversed, multiplied by a factor, or combined with other reactions.
50. Calculate equilibrium concentrations and $K$ from known initial concentrations and one known equilibrium concentration.
51. Predict the direction of reaction from the equilibrium constant and known concentrations ($Q$).
52. Calculate the equilibrium concentration of species at equilibrium given their initial values and the equilibrium constant.

8. Describe the different models of acids and base behavior, and the molecular basis for acid strength. (Related to HED Core Competencies Area III no. 2)
53. Define acids and bases by Bronsted-Lowry, and Lewis
54. Determine relative acidity by structural analysis for different acids
55. Write conjugate acid-base pair and compare relative strength
56. Acidity in aqueous solution - leveling effect and pH scale.
57. Acidity in aqueous solution - autoionization, pH and pOH relation.

9. Apply equilibrium principles to aqueous solutions, including acid-base and solubility reactions; calculate pH and species concentrations in buffered and unbuffered solutions. (Related to HED Core Competencies Area III no. 2 and 4 and Area II no. 2)
58. pH calculation - strong acids and strong bases
59. pH calculation - weak acids and weak bases
60. pH calculation - conjugate acid of weak base and conjugate base of weak acid
61. pH calculation - percent dissociation and approximation
62. pH calculation - polyprotic acids
63. pH calculation - buffer solution pH, buffer preparation
64. Qualitative prediction of salt acidity/basicity
65. Solubility - expression of solubility product, $K_{sp}$, common ion effect and pH effect
66. Solubility - calculate molar salt solubility and initial ion concentrations for precipitation

10. Explain titration curves and speciation diagrams; calculate concentrations of reactants from the former and determine dominant species as a function of pH from the latter. (Related to HED Core Competencies Area III no. 2 and 4 and Area II nos. 1 and 2)
67. Interpret key features of different types of pH titration (e.g. strong acid into weak bases)
68. Calculate pKa's for analytes such as weak acid and weak base
69. Solution stoichiometry
70. pH calculation along any point of titration curve (exact pH calculation), including endpoint pH
71. Select suitable indicators for acid-base titration
72. Determine dominant species along any point of titration curve
73. Determine dominant species for polyprotic acids via speciation diagrams (e.g. phosphoric acid, proteins)
11. Explain and calculate the thermodynamic functions enthalpy, entropy and Gibbs free energy for a chemical system; relate these to equilibrium constants and reaction spontaneity. (Related to HED Core Competencies Area III no. 2 and 4)

74. Explain how entropy relates to physical state, molecular sizes and structure
75. Qualitatively predict signs of entropy change for phase transitions and chemical reactions
76. Explain Hess's law and apply it to quantities (H, G, S) in chemical reactions
77. Predict spontaneity according to sign of $\Delta G$ or $\Delta S$

12. Balance redox equations, express them as two half reactions and evaluate the potential, free energy and equilibrium K for the reaction, as well as predict the spontaneous direction. (Related to HED Core Competencies Area III no. 2 and 4)

78. Determination of oxidation numbers - redox reactions, half reactions
79. Balance redox reactions using half reactions
80. Calculate Gibbs free energy and equilibrium constant for redox reactions

13. Construct a galvanic or electrolytic cell; determine the standard (and non-standard) cell-potential of the former and relate current to electron transfer rates in the latter. (Related to HED Core Competencies Area III no. 2 and 4).

81. Construction of a Galvanic cell - cell components, functions, flow of electrons and ions
82. Apply the Nernst equation to find nonstandard cell potentials
83. Calculate the quantities in electrolytic cells

SYLLABUS for CHEM 121

Instructor: Prof. ABC  
Email: abc@unm.edu
Office Location: SMLC 1st Floor  
Office Phone: 505-277-1111
Office Hours: MWF 10-11 AM  
Course Credits: 3 CH
Class Meeting Day(s): MWF  
Class Time: 9:00 – 9:50 AM
Class Location / Room: DSH 125  
Term / Semester: Fall 2015

Course Description

Introduction to the chemical and physical behavior of matter. Meets New Mexico Lower Division General Education Common Core Curriculum Area III: Science (NMCCN 1214).

Course Objectives and Student Learning Outcomes

CHEM 121 should be able to

1. Relate the development of essential chemical theories to the application of the scientific method. (Related to HED Core Competencies Area III no. 1)
2. Use dimensional analysis, the SI system of units and appropriate significant figures to express quantities, convert units and perform quantitative calculations in science. (Related to HED Core Competencies Area III no. 2 and 5)
3. Explain the structure of the atoms, isotopes and ions in terms of its subatomic particles. (Related to HED Core Competencies Area III no. 1 and 2)
4. Use the IUPAC system of nomenclature and knowledge of reaction types to describe chemical changes, predict products and represent the process as a balanced equation. (Related to HED Core Competencies Area III no. 4)
5. Describe physical states and changes, and distinguish these from chemical changes. (Related to HED Core Competencies Area III no. 4)
6. Apply the mole concept to amounts on a macroscopic and a microscopic level and use this to perform stoichiometric calculations including for reactions in solution, gases and thermochemistry. (Related to HED Core Competencies Area III no. 2 and 4)
7. Apply the gas laws and kinetic molecular theory to relate atomic level behavior to macroscopic properties. (Related to HED Core Competencies Area III no. 2 and 4)
8. Describe the energy conversions that occur in chemical reactions, relating heat of reaction to thermodynamic properties such as enthalpy and internal energy; calculate and describe how to measure energy changes in reaction. (Related to HED Core Competencies Area III no. 4 and 5)
9. Use different bonding models to describe formation of compounds (ionic and covalent). Apply knowledge of electronic structure to determine molecular spatial arrangement and polarity. (Related to HED Core Competencies Area III no. 4)
10. Analyze how periodic properties (e.g. electronegativity, atomic and ionic radii, ionization energy, electron affinity, metallic character) and reactivity of elements results from electron configurations of atoms. (Related to HED Core Competencies Area III no. 4)
11. Apply principles of general chemistry to specific real world problems in environment, engineering and health-related fields. (Related to HED Core Competencies Area III no. 4 and Area II no. 2)

Course Requirements

Textbook: Chemistry by Tro, 2nd or 3rd edition

ALEKS access: You must purchase access for 1 ($60) or 2 semesters ($70). You can purchase directly from ALEKS (www.aleks.com) or through UNM bookstore.

Calculator: Must be a simple scientific calculator for classroom, homework, and exam use. The calculator should not have a graphing or programming functions.

i-clicker: available to be purchased in UNM Bookstore. You must register during the first week of the semester through on-call registration set up in the first 5 minutes of each class, and make it available for use in every class. The i-clicker will not be available for loan by the instructor.

Midterm exams: There will be four midterm exams administered in scheduled classes. The tentative schedule of these exams are listed below. Date and time are subject to change through announcement in the class. You are responsible for following any schedule changes.

Midterm 1 (9/11), Midterm 2 (10/15), midterm 3 (11/12), and midterm 4 (12/1).

Final exam: A comprehensive final exam will be administered during the UNM final’s week. The date, time, and room are listed under UNM registrar’s website. The final exam is two hours. Fail to take the final exam will result in a “W” grade.

Attendance: Attendance to the classes will not be required, but skipping a class can result in losing points from iclicker questions and other credits given for in-class activities.

Grading

Attendance Policy (Suggested minimum language) Regular and punctual attendance is required. UNM Pathfinder policies apply, which in part means instructor drops based on non-attendance are possible. This policy applies regardless of the grading option you have chosen.

Accommodation Statement (required language) Accessibility Services (Mesa Vista Hall 2021, 277-3506) provides academic support to students who have disabilities. If you think you need alternative accessible formats for undertaking and completing coursework, you should contact this service right away to assure your needs are met in a timely manner. If you need local assistance in contacting Accessibility Services, see the Bachelor and Graduate Programs office.
Academic Integrity *(Suggested language)* The University of New Mexico believes that academic honesty is a foundation principle for personal and academic development. All University policies regarding academic honesty apply to this course. Academic dishonesty includes, but is not limited to, cheating or copying, plagiarism (claiming credit for the words or works of another from any type of source such as print, Internet or electronic database, or failing to cite the source), fabricating information or citations, facilitating acts of academic dishonesty by others, having unauthorized possession of examinations, submitting work of another person or work previously used without informing the instructor, or tampering with the academic work of other students. The University's full statement on academic honesty and the consequences for failure to comply is available in the college catalog and in the Pathfinder.

Cell Phones and Technology *(Suggested)* As a matter of courtesy, please turn off cell phones, pagers, and other communication and entertainment devices prior to the beginning of class. Notify me in advance if you are monitoring an emergency, for which cell phone ringers should be switched to vibrate.

Library and Tutorial Services *(Suggested)* UNM-Main campus provides many library services and some tutorial services for distance students. For library services, go to [http://www.unm.edu/libraries/](http://www.unm.edu/libraries/) to link to a specific library or to contact a librarian. For tutorial services, go to [http://caps.unm.edu/online](http://caps.unm.edu/online) to explore UNM’s online services.

Other *(optional--include information about helpful resources, study requirements, or anything that may help students in the class or help you manage the class.)*

**SCHEDULE OF ACTIVITIES** *(Use any format, but be sure to list all assessable activities and their dates, holidays, due dates, field trips, etc. Always include a disclaimer about change—see below.)*

WEEK ONE—

WEEK TWO—

*The Schedule of Activities is subject to change. Minor changes will be announced in class, major ones provided in writing.*
Appendix xx i-Clicker setup

Download i-clicker software

You can download the software from i-clicker website: https://www1.iclicker.com/downloads-release-notes/
or from our community website http://genchem.pbworks.com

Tutorial for setup i-clicker

Start iclicker.exe from the software folder.

Click on New to create a new course.

Select the new course you just created and “Choose” button:
In the next window, you press the “My Setting” button to set up your options.

You will enter the My Setting window which consists of many tabs that you can go to for different parameter settings:

- General
- i-clicker GO
- LMS/Reg
- Polling
- Scoring
- Results
- Base Display
- Demographics

Once you finish setting each tab, you have three choices of action: Set for Course, Set for Session, or Cancel. The set for course button makes your setting effective until you change any parameter of this window again. The set for session button is only effective for this session; if you close the program, all changes will return to the last setting.
Customize toolbar

- Toolbar size: Normal
- Transparency: Low

The toolbar remembers its last location on the screen.

Polling timer

- Count up from 0 seconds
  - Polling does not end until manually stopped.
- Count down from 00:30 (min:sec)
  - Polling ends automatically when time expires or when manually stopped.

Participation points

- Session participation points: 1
  - Points are awarded all-or-nothing for the session

To earn participation points students must respond to:

Performance points

- Points for responding: 0
  - Each question is worth the total of the point values below.
- Points for correct response: 1

Limit the total performance points earned in a session to a maximum of:

Multiple choice (A-E) results

- Color
- Monochrome

Numeric response results

- Bar chart
  - Number of significant figures: 8
- Histogram
  - Number of bins: 5

Alphanumeric response results

- Number of significant characters: 16

Correct answer display

- For questions with pre-assigned correct answers.
  - Show correct answers when polling is stopped
  - Hide correct answers until displayed manually
**Tutorial for set up i-grader**

Start the i-grader program: i-grader.exe

Choose a course and press the “Choose” button.
Appendix xxx Manage ALEKS account

Login to ALEKS

http://aleks.com

Under “Instructor”, choose your name. You can move the items in the dashboard to different location as you prefer.
You can choose a course to work on.

Or you can create a new course by going under “Instructor Administration” menu, and select “New Class” under the “CLASSES” sub-menu.

Most commonly, you will choose “Create a custom class” under the New Class menu. You can also copy a class from this UNM site, in case you know a course template or other faculty’s class.
Under a new class window, you choose the appropriate class type:

**Class Information**

- **Instructor**
  - I will be teaching this class
  - Another instructor will be teaching this class
  - Select instructor: (Choose one)

- **Course product**
  - (Choose one)
  - General Chemistry (First Semester)
  - General Chemistry (Second Semester)
  - Math Prep for Statics

- **Name**
  - (Choose one)
  - Summer Prep For General Chemistry
  - Introductory College Chemistry
  - Preparation for General Chemistry

- **Section (optional)**
  - (Choose one)
  - General Chemistry (First Semester)
  - General Chemistry (Second Semester)

- **Dates**
  - (Choose one)
  - Math Prep for Statics

- **Course Specific Settings**
  - Automatically archive this class after the end date

No settings available for this course product.
And fill out the rest of the fields and press the “Create Class Now” button.

Now you will see the following window:

You can choose this option to see the summary

Or

You can choose this option to continue

On more options.
Congratulations! CHEM 121 001 is now using the New Student Module. Check out the new Learning and Assessment Options.

**Class Information**

- **Instructor:** I am teaching this class
- **Name:** CHEM 121 001
- **Section:** Fall 2015
- **Course Product:** General Chemistry (First Semester)
- **Start Date:** 08/03/2015
- **End Date:** 12/31/2015
- **Archival Settings:** Do not archive after class end date.
- **Subscription Length:** Higher-Ed any access code
- **Settings:** N/A
- **Significant Digits Options:** N/A
- **Enforce Significant Digit Rules:** Yes
- **Pop-up Warning in Learning Mode:** Off

**Class Content**

You can integrate a textbook, set intermediate objectives, and customize the content of your class.

- **Customize Class Content**

**Implementation Information**

- **Progress Goal**
- **Progress:** N/A
- **Min Time Required:** N/A
- **Implementation Scenario**
- **Scenario:** N/A

**Resources**

There are no resources for this class.

**What's Next:**

- Explore the Student View
- Access the ALEKS Training Center

**Syllabus**

- View Syllabus: HTML, PDF

**Class Options**

- **Access Options**
  - **Student Enrollment Status:** Open
  - **Class Access:** Regular
  - ** Archived Status:** Not archived
  - **Student Activity Notifications:** None

- **Learning Options:** None

- **Assessment Options**
  - **Initial Assessment Location:** Anywhere
  - **Other Assessment Location:** Anywhere
  - **Progress Assessment Delay Window:** 24 hours

- **Worksheet Options**
  - **Content:** 18 Review Questions
  - **Notification:** Off
  - **Access:** None

**Class Duplicate Settings**

- **Status:** Private

Colleagues and peers cannot duplicate the settings, content and assignments for this class.
You can always come back to Class Summary and change the setting by going under the “Class Administration” menu and choose “Class Summary”. This section contains all options of a class setting.
Appendix Peer Led Facilitator (PLF)
Looking Back and Planning Forward

• What is the team’s plan for revising elements of the redesign before the upcoming fall semester?
• Who needs to be included as the project implementation expands?
• What tasks will team members undertake during the summer?
• How can you disseminate what you’ve learned during the redesign?
At the conclusion of the funded-year for STEM Gateway Course Redesign Projects, teams assess successes and challenges from the redesign work and plan an improved pathway forward in the coming academic year. These expectations match the commitments that STEM Gateway has with the Department of Education’s funding support.

As a part of this end-of-year wrap up, each team leader will also prepare a short report that accomplishes the following:

1. **Abstract**: A brief ~ 1 page summary summarizing the report (project motivation and goals, summary, assessment, improvement, expansion, sustainability, and challenges). This abstract will be shared with department Deans and Chairs for our annual share-out meeting.
2. **Project motivation and goals**: A brief explanation of the motivation of the redesign project and the goals that were established at the outset (along with any modification of goals that were developed during the year)
3. **Project summary**: Summarize the instructional redesign components (this will likely come from the proposal along with modifications that may have been made)
4. **Assessment**: Present any and all data obtained as part of the originally stated or modified assessment plan that are related to students’ (a) learning (e.g., outcomes assessment data, pre/post-test or concept-inventory results), (b) success (e.g., grades), and/or (c) attitudes (e.g., surveys). These data should be briefly interpreted.
5. **Improvement**: Provide a summary of the curricular and pedagogical changes you are planning to make in light of the collected assessment data and your teaching experiences.
6. **Expansion**: Outline your plan for continuation of the redesign project, which should include (a) an indication of the approximate number of sections of the course that will be taught using the redesign in Fall 2016 and Spring 2017 and (b) who the likely instructors will be and/or how those instructors will be recruited. If, compared to Spring 2016, there will be no increase, or there is a decrease, in the number of sections taught with the redesign, then please provide a rationale.
7. **Sustaining**: A plan for sustaining the curricular and pedagogical innovations of the redesign. This section should include (a) achievements and/or intentions for accessible curation and dissemination of redesigned instructional components, (b) plans for continued work by the team to assess outcomes and make adjustments for continuous improvement, and (c) plans for assuring successful, self-efficacious implementation of the redesigned course elements by instructors who were not part of the original team.
8. **Challenges**: List the major challenges to your redesign project. Indicate, if appropriate, who assisted or could assist your team in overcoming the obstacles you face.

All team members should participate in these processes and teams are encouraged to commit to some face-to-face meeting time for that purpose. STEM Gateway redesign project staff will attend a session with each team at the beginning or very early during these summer activities, at any time during the summer at the request of the team leader (or individually with team members), and will also meet with each team leader after submission of the report.

*Please submit your report by August 14, 2016*
