

August 18, 1954

WJK54-08-18-01

Went out to Suvaone & made a collection,
A 89 W. 65 ~~44~~ 1645

Gala was not ripe but some were in color.

1 Rhinichthys ♀ was very ripe.

No Pantodon were seen

Two landslides in this general area have affected the stream although not as drastically as I would like. In places the water must have been 8 feet deep. ^{From} Immediately ^{below} ~~above~~ the bouldered section to the Rio San Jose, the water must have been wall to wall. It seems that 18 inches or so of silt has been deposited in much of the lower portion. The lot as many plants were washed out or a channel formed as desirable. The Rio San Jose is very high and so is the Puerto. ^{at Hwy 66} The latter certainly was too deep & swift for crossing.
