

Biomphalaria glabrata GENOME INITIATIVE

rDNA gene region (18S-ITS1-5.8S-ITS2-28S) of *Biomphalaria glabrata*

Caveat

Use of the sequence data presented here is at your own discretion

Ongoing gene discovery efforts (byproducts of EST sequencing at UNM; Adema et al.) and the WGS trace files generated during the feasibility studies phase of the genome sequencing at WUGSC (Clifton et al.) have each yielded multiple sequences representing the rDNA gene region of *Biomphalaria glabrata*. Contig analysis of these independent data sets has yielded mutually confirmatory consensus sequences for the rDNA cassette of both M line and BB02 strain *Biomphalaria glabrata*. Both sequences represent a majority consensus, and may differ somewhat from specific copies of rDNA gene cassettes that are tandemly arranged in the genome. Similarity to eukaryote signal sequences for termination of transcription of LSU rDNA is interpreted to indicate that the sequences putatively contain the complete, full-length 28S gene. This has **NOT** been confirmed experimentally, however.

Currently, GenBank does not offer a database format that can accept consensus sequences generated from contig alignments. Consequently, GenBank could not accept the sequence submissions shown below. As an alternative, the information is provided here for the benefit of the *Biomphalaria* research community, as it may be helpful for phylogenetic studies and for validation of EST data. Full effort has been given to assure that the data are correct, but realize that GenBank has not curated these sequences.

Therefore, **use of the sequence data presented here is at your own discretion**

(Note added in 2019) The below sequence data provide mutual confirmation for Zhang SM, Bu L, Laidemitt MR, Lu L, Mutuku MW, Mkoji GM, Loker ES (2018) Complete mitochondrial and rDNA complex sequences of important vector species of *Biomphalaria*, obligatory hosts of the human-infecting blood fluke, *Schistosoma mansoni*. Sci Rep. 2018 May 9;8(1):7341. doi: 10.1038/s41598-018-25463-z. PMID: 29743617).

Rationale for the assumption that the 28S gene of *Biomphalaria glabrata* is complete

The 28S sequences from *Biomphalaria glabrata* share similarity with eukaryote transcription termination sites at the 3' termini of the 26S LSU from *Saccharomyces carlsbergensis* (Yeast) and the 28S of *Xenopus laevis*. The alignment is based on data from Veldman GM, Klootwijk J, de Jonge P, Leer RJ and Planta RJ. 1980 **The transcription termination site of the ribosomal RNA operon in yeast. Nucleic Acids Research 8 (22), 5179-5192.** In the sequences below, the residue at position -1 is designated as the **putative** end of the 28S gene.. The pre-RNA may extend beyond the terminus of 28S. Alternative downstream termination sites may exist. Additionally, sequence length and sequence similarities with 28S sequences in GenBank support the assumption that the *Biomphalaria glabrata* 28S is complete.

Identical residues are in bold, the negative numbering identifies residue positions upstream of the **putative** end of transcription.

Biomphalaria glabrata M line strain rDNA

Use the below sequence at your own discretion.

This is a majority consensus of a contig-alignment of 1285 cDNA inserts (single pass sequences) representing rRNA sequences that resulted as a by-product of gene discovery efforts using RNA of M line *Biomphalaria glabrata*.

18S-ITS1-5.8S-ITS2-28S (6674 nt: 1514 A 1683 C 2028 G 1549 T)

Biomphalaria glabrata BB02 strain rDNA

Use the below sequence at your own discretion

The above M line sequence was BLASTed against the *Biomphalaria glabrata* WGS data in the NCBI trace-file archive. Reiterative BLASTing with the resulting contiguous WGS sequences was performed to expand the termini of the sequence contig. Below is the minimal set of (DDBJ/EMBL/GenBank) WGS entries used for this majority consensus of genomic DNA:
