ATTACHMENT B

**SNL/NM Responses to the
EPA Risk Assessment Comments**

Dated April 19, 1996

ATTACHMENT B

Sandia National Laboratories Responses to the EPA April 19, 1996, Comments on the Liquid Waste Disposal System RFI Report Comments Related to the Risk Assessment

General Comments

The specific parameter values and some of the models utilized in the Precis computer code are currently under review by EPA. Even if substantial comments are generated at a later date for the parameter values and the Precis code, the final conclusions for Site 52, 4, and 5 should not be impacted. This is expected since the maximum detected concentrations at Site 52 (see Table 4-2, page 4-9) are below risk-based concentrations and conclusions for Site 4 and 5 are based on the elimination of potential exposure pathways.

The following specific comments are offered to clarify information in the report and in anticipation that this same methodology will be used at other Sandia sites.

Response: Sandia National Laboratories/New Mexico (SNL/NM) and the U.S. Department of Energy (DOE) agree with the U.S. Environmental Protection Agency (EPA) assessment of no impact on Liquid Waste Disposal System (LWDS) sites and appreciate the clarifications provided in these comments.

Specific Comments

1. Page 3-1; Section 3.0; Data Evaluation

According to the report, constituents of concern (COCs) were selected based on a statistical comparison to background and on their spatial correlation. The report further states that constituents were selected as COCs only if both criteria were met. It is not clear what is meant by the term "spatial correlation" and how Sandia established and determined a "strong spatial correlation."

Response: The term "spatial correlation" refers to the spatial distribution of contaminants and to whether or not the contaminant concentrations are realistic and appear to make sense with respect to the conceptual model. SNL/NM evaluated the spatial distributions of contaminants by geostatistically contouring the contaminant concentration data and evaluating the contaminant concentration isopleth locations.

For example, Figures 4-7 through 4-11 present the spatial distributions of cadmium, chromium, beryllium, cesium-137, and cobalt-60 beneath the LWDS drainfield. Figures 4-16 through 4-26 present the spatial distributions of cadmium, chromium, copper, lead, nickel, zinc, barium, cobalt-60, cesium-137, uranium-235, and polychlorinated biphenyls in the LWDS impoundments. In most of these cases, there appear to be relatively strong spatial correlations between parameter values and sample locations.

2. Page 3-6; Table 3-2; Summary of Background Concentrations for Metals in Soil

Barium consists of a very wide range of concentrations, ranging from 0.13 ppm to 730 ppm. Concentrations could not be verified since individual background data points were not located within the report. EPA recommends that the relevant data be included in the report, or that a review of the draft Background Study report be conducted with respect to barium.

Response: To enable concentrations to be verified, all barium data for Environmental Restoration (ER) Sites 4, 5, and 52 are presented in Tables A-1, A-4, and A-7 in Attachment A of this submittal.

3. **Page 3-10; Table 3-4; Summary of Background Concentrations for Metals and Nitrate plus Nitrite in Ground Water**

All three detected metals for ground water background approximate (barium with a maximum value of 1.3 ppm, MCL is 2.0 ppm) or exceed MCLs (total chromium and lead). It is difficult to verify these background values since the individual data were not submitted in the report.

Response: Groundwater quality data from the Technical Area (TA)-V monitoring wells are submitted each year to the DOE, the New Mexico Environment Department, and the EPA through SNL/NM's Annual Groundwater Monitoring Report (written by the SNL/NM Groundwater Protection Program, Department 7575). Copies of the groundwater quality data tables from these reports (for TA-V monitoring wells) are presented in Attachment D of this submittal.

4. **Page 4-9; Table 4-2; Statistical Comparison of Site 52 to Background**

It is not clear what is meant by "spatial correlation" and how it was determined.

Response: See SNL/NM's response to Specific Comment 1.

5. **Page 4-10; Section 4.1.4; Risk Assessment**

It should be noted that the evaluation conducted in this section is a risk screen, not a risk assessment. The term "risk assessment" relates to the estimation of potential risk based on definitive exposure scenarios and is a rigorous process. A risk screen is a comparison of investigation data to protective screening levels.

Since the list of COCs and their respective concentrations evaluated in the risk screen represent a subset of the detected COCs, the conclusion cannot be confirmed. Furthermore, the methodologies used to select the COCs cannot be confirmed (see related comments to page 3-1 and 4-9). Therefore, the conclusions for the holding tanks cannot be fully evaluated.

Response: SNL/NM agrees that the evaluation discussed in Section 4.1.4 was a risk screening, which indicated that a risk assessment was not necessary for ER Site 52. During the LWDS RCRA Facility Investigation (RFI), only four COCs were identified for ER Site 52—beryllium, copper, nickel, and zinc. These COCs were identified based on their relative concentrations with respect to the background upper tolerance limits and to Subpart S Action Levels. The methodologies used to select the COCs are discussed in EPA 1992 and EPA 1996.

6. **Page 4-17; Table 4-4, Statistical Comparison of Site 5 to Background**

EPA is unable to verify the information on this table (see related comment to page 4-9).

Response: The soil analytical data summarized in Table 4-4 are presented in Tables A-4, A-5, and A-6 in Attachment A of this submittal. The statistical methods used to develop this table are discussed in

EPA 1992 and EPA 1996. Also, please refer to the responses to Specific Comments 4 and 5 related to spatial correlation.

7. Page 4-23; Section 4.2.4; Risk Assessment

It is EPA's understanding that a 15 mrem/yr radiation dose limit will be used to evaluate potential risk due to radionuclides.

Response: SNL/NM agrees; the 25 millirems per year (mrem/yr) dose limit originally proposed by SNL/NM in the LWDS RFI report was applied erroneously, and SNL/NM currently uses a 15 mrem/yr dose limit to evaluate potential risk due to radionuclides. ER Sites 5 and 52 also meet the proposed EPA dose limit of 15 mrem/yr (40 CFR 196, 1994).

8. Page 4-34; Table 4-6; Statistical Comparison of Site 4 to Background

See related comment to page 4-9.

Response: See related response to Specific Comments 4 and 5 concerning page 4-9 and spatial correlation.

9. Page 4-41; Section 4.3.4; Risk Assessment

It is EPA's understanding that a 15 mrem/yr radiation dose limit will be used to evaluate potential risk due to radionuclides.

Response: SNL/NM concurs; a 15 mrem/yr radiation dose limit is used to evaluate potential risk due to radionuclides.

The total dose from all individual radionuclides (cobalt-60, cesium-137, tritium, and uranium-235) at the LWDS surface impoundments was calculated to be approximately 19.7 mrem/yr assuming an industrial land use and an office worker scenario, or 23.4 mrem/yr assuming an industrial land use with the worker outside 50 percent of the time. These values are only slightly above the EPA's proposed 15 mrem/yr radiation dose limit.

However, once the surface impoundments are backfilled with native soil (as recommended in Section 4.3.5 on page 4-42), the total annual dose (assuming industrial land use, with the worker outside 50 percent of the time) is only $1.9 \text{ E-}6$ mrem/yr, a value well below the 15 mrem/yr dose limit.

10. Annex I; Page 5; Section 2.3; Constituents of Concern

In some instances, the upper end of the distribution was set at some value other than the maximum detected concentration, e.g., zinc. It should be noted that even though in the specific case of zinc at the Site 5 the use of the maximum value may not have changed the outcome, EPA recommends that the upper end of the distribution be defined by the maximum detected concentration when that concentration represents a more protective value than the calculated 99.9 percentile.

Risk assessment conclusions for Site 5 are based on the assumption that there will be 25 feet of soil overlying the site. This eliminates the surface exposure pathways thereby eliminating the potential risk.

Response: Currently, SNL/NM uses the maximum concentrations from environmental samples collected at ER sites to calculate the hazard index and cancer risk for a particular site. To be consistent with current risk assessments, SNL/NM has recalculated the risk assessment values for the LWDS soil COCs. Individual risk assessment values were calculated for the LWDS sites (ER Sites 4, 5, and 52) and for the overall LWDS maximum concentrations. The recalculated risk assessment values indicate a maximum hazard index of 0.4 and a cancer risk of 7.0 E-6 (Tables B-1 through B-4).

SNL/NM and DOE agree that the lack of surface exposure pathways for ER Site 5 eliminates all potential risk.

11. Annex II; Page 1; Section 1.0; Introduction

It is EPA's understanding that a 15 mrem/yr dose rate will be used for the evaluations of radionuclides.

A two meter cover of clean soil was assumed for the final conclusions of the risk assessment for Site 4.

Response: The 25 mrem/yr dose limit was applied erroneously to the LWDS RFI; SNL/NM is currently using the EPA's proposed 15 mrem/yr radiation dose limit. See response to Specific Comment 9.

The EPA was correct in stating that a 2 meter cover of clean soil was assumed for the final conclusions of the risk assessment. The proposal to backfill the impoundments to grade for safety reasons is discussed in Section 4.3.5 (p 4-42) of the RFI report.

Table B-1. Risk Assessment Values for LWDS Soil COCs, ER Site 4 Maximum Concentrations.

COC Name	Maximum Concentration (mg/kg)	Industrial Land-Use Scenario	
		Hazard Index	Cancer Risk
Barium	849	0.01	-- ^a
Beryllium	4.9	0.00	7E-6
Cadmium	154	0.30	5E-8
Chromium, total ^b	97.7	0.03	--
Chromium VI	11.2	0.00	3E-8
Copper	239	0.01	--
Lead ^c	72.5	--	--
Nickel	173	0.01	--
Silver	90.5	0.02	--
Zinc	198	0.00	--
PCBs	0.071	0.00	2E-7
TOTAL		0.4	7E-6

^a-- indicates information is not available.

^bChromium, total is assumed to be chromium-III.

^cEPA guidance for the screening value for lead for an industrial land-use scenario is 2,000 mg/kg (EPA 1996); for a residential land-use scenario, the EPA screening guidance value is 400 mg/kg (EPA 1994). The maximum concentration value for lead at this site is less than both of those screening values, and therefore lead is eliminated from further consideration.

Table B-4. Risk Assessment Values for LWDS Soil COCs, Overall Maximum Concentrations.

COC Name	Maximum Concentration (mg/kg)	Industrial Land-Use Scenario	
		Hazard Index	Cancer Risk
Barium	849	0.01	-- ^a
Beryllium	4.9	0.00	7E-6
Cadmium	154	0.30	5E-8
Chromium, total ^b	97.7	0.03	--
Chromium-VI ^c	42.4	0.01	9E-8
Copper	239	0.01	--
Lead ^d	72.5	--	--
Nickel	173	0.01	--
Silver	90.5	0.02	--
Zinc	198	0.00	--
PCBs	0.071	0.00	2E-7
TOTAL		0.4	7E-6

^a -- indicates information is not available.

^bChromium, total is assumed to be chromium-III.

^cChromium-VI value is from chromium, total value for ER Site 5 (chromium-VI was not analyzed for at ER Site 5).

^dEPA guidance for the screening value for lead for an industrial land-use scenario is 2,000 mg/kg (EPA 1996); for a residential land-use scenario, the EPA screening guidance value is 400 mg/kg (EPA 1994). The maximum concentration values for lead at these sites are less than both of those screening values, and therefore lead is eliminated from further consideration.

Albuquerque, NM 87110-3929

January 12, 1997

Tim Goering
Environmental Restoration Department
Sandia National Laboratories
Albuquerque, NM

Dear Mr. Goering,

As requested, please find enclosed lithologic logs of boreholes drilled at the Liquid Waste Disposal System facility, Sandia National Laboratories. Lithologic descriptions done by U.S. Geological Survey staff (Joe Szalona and myself) included the following:

Liquid Waste Disposal System -LWDS-BH1;
Liquid Waste Disposal System -LWDS-BH2;
Liquid Waste Disposal System -LWDS-BH3;
Liquid Waste Disposal System -LWDS-BH4;
Liquid Waste Disposal System -LWDS-BH5;
Liquid Waste Disposal System -LWDS-BH6;
Liquid Waste Disposal System -LWDS-BH7;
Liquid Waste Disposal System -LWDS-BH8;
Liquid Waste Disposal System -LWDS-MW1; and
Liquid Waste Disposal System -LWDS-MW2.

If you have any questions regarding the enclosed information, please contact me at 505-262-5358.

Sincerely,

Cynthia G. Abeyta
Hydrologist

Enclosures: Lithologic logs for LWDS-BH1 through BH8, LWDS-MW1, LWDS-MW2
Figure 1.--Protocol used in naming of unconsolidated sediments.

Naming of Unconsolidated Sediments

Main particle	Gravel	Sand	Silt	Clay
Greater than 15 percent gravel	Gravel	Gravelly sand	Gravelly silt	Gravelly clay
Greater than 15 percent sand	Sandy gravel	Sand	Sandy silt	Sandy clay
Greater than 15 percent silt	Silty gravel	Silty sand	Silt	Silty clay
Greater than 15 percent clay	Clayey gravel	Clayey sand	Clayey silt	Clay
5-15 percent gravel	Not applicable	Sand with gravel	Silt with gravel	Clay with gravel
5-15 percent sand	Gravel with sand	Not applicable	Silt with sand	Clay with sand
5-15 percent silt	Gravel with silt	Sand with silt	Not applicable	Clay with silt
5-15 percent clay	Gravel with clay	Sand with clay	Silt with clay	Not applicable
Greater than 15 percent gravel plus greater than 15 percent sand	Sandy gravel	Gravelly sand	Gravelly sandy silt	Gravelly sandy clay
Greater than 15 percent gravel plus greater than 15 percent silt	Silty gravel	Gravelly silty sand	Gravelly silt	Gravelly silty clay
Greater than 15 percent gravel plus greater than 15 percent clay	Clayey gravel	Gravelly clayey sand	Gravelly sandy silt	Gravelly clay
Greater than 15 percent sand plus greater than 15 percent silt	Silty sandy gravel	Silty sand	Sandy silt	Sandy silty clay
Greater than 15 percent sand plus greater than 15 percent clay	Sandy clayey gravel	Clayey sand	Sandy clayey silt	Sandy clay
Greater than 15 percent silt plus greater than 15 percent clay	Silty clayey gravel	Silty clayey sand	Clayey silt	Silty clay

NOTE: Other combinations are possible when all particle sizes are present in greater than 15 percent; for example, a Silty clayey gravelly sand. Other possible combinations exist such as a Gravelly sand with silt.

LITHOLOGIC LOG

Area 5, Liquid Waste Disposal System - (LWDS-1)

Note: Core was collected from 0' to 98'.

Lithologies logged by U.S. Geological Survey Geologists Cynthia Abeyta and Joe Szalona as follows:

<u>Depth</u>	<u>Date</u>	<u>Geologist</u>
0' to 8'	08Aug92 to 08Aug92	J. Szalona
8' to 62'	08Aug92 to 08Aug92	C. Abeyta
62' to 66'	08Aug92 to 08Aug92	J. Szalona
66' to 98'	09Aug92 to 09Aug92	C. Abeyta

Percentage of hole logged by each geologist:

C. Abeyta	88%
J. Szalona	12%

Table 1.--Lithology penetrated by borehole LWDS-BH1

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]]

Lithologic description	Depth interval below land surface (feet)
Silty sand; sand--very fine to fine grained, pebbles < 1% and ≤ 35 mm, subangular to subrounded, fairly well sorted with pebbles scattered; pebbles--quartz; light brown (5YR5/6) with middle zone moderate-yellowish-brown (10YR5/4); numerous roots in upper 1.5 ft; loose, no reaction with HCl in upper 1.4 ft, otherwise moderate to strong reaction; upper 1.4 ft--moist, otherwise very slightly moist to dry; abrupt basal contact -----	0-13.5
Pebbly silty sand; sand--very fine to fine grained, pebbles ≤ 15% and ≤ 63 mm, cobbles < 1% and ≤ 75 mm, subangular to subrounded, very poorly sorted; pebbles and cobbles--quartzite; moderate-yellowish-brown (10YR5/4); loose, finer matrix--strong reaction with HCl; very slightly moist -----	13.5-16
Silty sand; sand--very fine to fine grained, pebbles < 1% and ≤ 10 mm, subangular to subrounded, fairly well sorted; pebbles--quartzite; moderate-yellowish-brown (10YR5/4); poorly laminated; moderately compacted, friable, strong reaction with HCl; slightly moist to moist in minor zones; abrupt basal contact -----	16-20.8
Silty sandy caliche with pebbles and cobbles; sand--very fine to fine grained, pebbles ≤ 8% and ≤ 63 mm, three cobbles ≤ 100 mm, subangular, moderately to poorly sorted; pebbles--metagranite, quartzite, cherty limestone, cobbles--limestone, granite, and quartzite; 20.8-22 ft--grayish-orange-pink (5YR7/2), 22-28 ft--moderate-yellowish-brown (10YR5/4); loose, strong reaction with HCl; dry; gradational basal contact -----	20.8-26
Silty sand with pebbles; sand--very fine to medium grained, pebbles ≤ 8% and ≤ 55 mm, five cobbles ≤ 111 mm located from 34-45 ft, coarser clasts--subangular to subrounded, moderately sorted to poorly sorted; sand--mostly quartz, minor feldspar, pebbles--limestone, quartzite, cobbles--four quartzite, one granite; 26-36.5 ft--moderate-yellowish-brown (10YR5/4), 36.5-40 ft--dark-yellowish-orange (10YR6/6), 40-42.5 ft--pale-yellowish-brown (10YR6/2), 42.5-48.4 ft--moderate-yellowish-brown (10YR5/4) with grayish orange (10YR7/4) at bottom; some zones from 26-40 ft are moderately laminated and contains clay lens approximately 30 mm thick containing subangular very coarse sand, caliche nodules in clay lens and in clay matrix; loose to moderately compacted, loose/powdery at bottom, strong reaction with HCl; dry to slightly moist; abrupt basal contact -----	26-48.4
Pebbly sand; sand--fine to very coarse grained, pebbles approximately 25% and ≤ 50 mm, cobbles < 5% and ≤ 75 mm, subangular to subrounded, very poorly sorted; sand--mostly quartz with minor feldspar, pebbles--quartzite, granite, limestone, cobbles--quartzose, shale; fine matrix--grayish orange (10YR7/4); sand zone at approximately 52.5-53.3 ft--medium grained, well sorted, angular to subangular, mostly quartz with less feldspar and minor mafics, moderate-yellowish-brown (10YR5/4), loose, moderate reaction with HCl, and moist; scattered coarse sand lenses with CaCO ₃ cementing with abundant laminations approximately 25 mm thick; loose, strong reaction with HCl; slightly moist; abrupt contacts at sand zone -----	48.4-54

Table 1.--Lithology penetrated by borehole LWDS-BH1--Concluded

Lithologic description	Depth interval below land surface (feet)
<p>Silty sand with pebbles; sand--mostly very fine to medium grained from 54-62 ft and very fine to fine grained from 62-66 ft, pebbles approximately $\leq 15\%$ and ≤ 50 mm, three cobbles--100 mm, 110 mm, and approximately 180 mm (fractured by drilling; CaCO_3 coatings on fractured sections), subangular to subrounded, very poorly sorted; sand--quartz with very minor mafics, pebbles--mostly quartzite, granite, minor limestone, cobbles--limestone; 54-62 ft--grayish orange (10YR7/4), 62-66 ft--pale-yellowish-brown (10YR6/2); loose with scattered moderately compacted zones, moderate to strong reaction with HCl; slightly moist -----</p>	54-66
<p>Sandy silt; sand--very fine to fine grained, moderately sorted, pebbles $< 1\%$ and ≤ 16 mm, subangular to subrounded, poorly sorted; pebbles--limestone; grayish orange (10YR7/4); loose, powdery, nodular--breaking into fine powder, moderate reaction with HCl; dry; abrupt basal contact -----</p>	66-74.6
<p>Silt, pebbles and cobbles; pebbles and cobbles approximately 50% and ≤ 90 mm (cut and fractured by drilling), cobbles probably larger than 90 mm, poorly sorted, silt matrix (assumed); pebbles and cobbles--quartzite, crystalline limestone; limestone--medium-light-gray (N6), quartzite--pinkish gray (5YR8/1) to light-brownish-gray (5YR6/1); pebbles and cobbles loose and broken up; dry -----</p>	74.6-77
<p>Silty sand with minor clay; sand--very fine to fine grained with zones of very fine to very coarse grains, pebbles $< 1\%$ and ≤ 20 mm, fairly well sorted except in zones containing very fine to very coarse grained sand where it is poorly sorted, angular to subrounded; sand--quartz, feldspar, limestone, pebbles--limestone, quartz; moderate-yellowish-brown (10YR5/4); slightly compacted, friable, moderate reaction with HCl; very slightly moist; gradational basal contact -----</p>	77-83
<p>Cobbly pebbly sand; sand--very fine to very coarse grained, pebbles and cobbles approximately 40%, pebbles ≤ 63 mm, cobbles > 90 mm (fractured during drilling), subangular, poorly sorted; pebbles and cobbles--quartzite, metagranite, limestone; matrix--grayish orange (10YR7/4); loose, some sections cemented with CaCO_3, moderate to strong reaction with HCl; dry -----</p>	83-86
<p>Pebbly cobbly sandy silt; sand--very fine to fine grained with minor medium to very coarse grains, cobbles and pebbles approximately 15% and ≤ 70 mm increasing toward bottom, subangular, poorly sorted; pebbles and cobbles--limestone, metagranite; pale-yellowish-brown (10YR6/2); loose, powdery, slight to moderate reaction with HCl; dry -----</p>	86-96

LITHOLOGIC LOG

Area 5, Liquid Waste Disposal System - (LWDS-2)

Note: Core was collected from 0' to 100'.

Lithologies logged by U.S. Geological Survey Geologists Cynthia Abeyta and Joe Szalona as follows:

<u>Depth</u>	<u>Date</u>	<u>Geologist</u>
0' to 51'	10AUG92 to 10AUG92	C. Abeyta
51' to 70'	10AUG92 to 10AUG92	J. Szalona
70' to 100'	10AUG92 to 11AUG92	C. Abeyta

Percentage of hole logged by each geologist:

C. Abeyta	81%
J. Szalona	19%

Table 2.--Lithology penetrated by borehole LWDS-BH2

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Silty sand; sand--very fine to fine grained, 8-9.8 ft sand--very fine to very coarse grained with pebbles approximately 3% and ≤ 40 mm, sand--angular to subangular, well sorted, 8-9.8 ft--poorly sorted; sand--quartz, minor feldspar and mafics, pebbles--granite, quartzite, greenstone; 0-8 ft--light brown (5YR5/6), 8-12.8 ft--moderate-yellowish-brown (10YR5/4); loose to slightly compacted, 0-8 ft--caliche present as blebs and in matrix, 0-8 ft--moderate to strong reaction with HCl, 8-12 ft--slight to moderate reaction with HCl; 0-8 ft--moist, 8-9.8 ft--wet (probably from decontamination of core barrel), 9.8-12 ft--slightly moist; abrupt basal contact -----	0-12.8
Silty sand with pebbles; sand--very fine to very coarse grained, pebbles approximately ≤ 15% and ≤ 40 mm, subangular to subrounded, very poorly sorted; sand--mostly quartz, less feldspar, limestone, pebbles--quartzite, granite, limestone, cherty limestone, 12.8-18 ft--grayish orange (10YR7/4), 18-23.2 ft--pale-yellowish-brown (10YR6/2); loose, no to moderate reaction with HCl; very slightly moist to dry; abrupt basal contact -----	12.8-23.2
Silty sand; sand--very fine to fine grained with minor medium grains, subangular to subrounded, fairly well sorted; sand--mostly quartz, minor feldspar and mafics; moderate-yellowish-brown (10YR5/4); fractured red sandstone at 2.5 ft from top of section; moderately cemented with CaCO ₃ , moderate to strong reaction with HCl; dry to very slightly moist -----	23.2-34.1
Pebbly silty sand with cobbles; sand--very fine to very coarse grained, pebbles and cobbles 15-25%, pebbles ≤ 63 mm, cobbles 63 mm to > 90 mm, subangular with minor subrounded, very poorly sorted; sand--quartz, minor feldspar, limestone, pebbles and cobbles--quartzite, limestone (crystalline and cherty), greenstone, sandstone; 34.1-41.6 ft--very-pale-orange (10YR8/2), 41.6-51 ft--yellowish gray (5Y8/1); loose, minor zones of CaCO ₃ cementing, moderate to strong reaction with HCl; dry to very slightly moist -----	34.1-51
Silty sand with pebbles and cobbles; sand--very fine to fine grained, pebbles and cobbles ≤ 12% and ≤ 75 mm, subangular (some fresh breaks due to drilling); pebbles and cobbles--quartzite, granite, and limestone; moderate-yellowish-brown (10YR5/4); loose, sand is slightly to moderately cemented with CaCO ₃ , strong reaction with HCl; slightly moist; abrupt basal contact -----	51-54.3
Pebbly sandy silt; sand--very fine to fine grained, pebbles ≤ 60 mm, subangular to subrounded, larger pebbles are subangular; pebbles--smaller clasts mostly limestone, larger clasts mostly quartzite; 54.3-55 ft--light-brownish-gray (5YR6/1), 55-66.5 ft--moderate-yellowish-brown (10YR5/4); loose, strong reaction with HCl; slightly moist -----	54.3-66.5
Silty sand; sand--very fine to fine grained; moderate-yellowish-brown (10YR5/4); slightly cemented with CaCO ₃ , strong reaction with HCl; slightly moist; gradational basal contact -----	66.5-68.4
Sandy silt; sand--very fine to fine grained; moderate-yellowish-brown (10YR5/4); loose, strong reaction with HCl; slightly moist -----	68.4-70

Table 2.--Lithology penetrated by borehole LWDS-BH2--Concluded

Lithologic description	Depth interval below land surface (feet)
Sandy silt; sand--very fine to fine grained, pebbles < 1% and \leq 15 mm, angular, fairly well sorted; pebbles--quartzite; grayish orange (10YR7/4) to yellowish-gray (5Y7/2); loose, powdery, nodular, nodules cemented with CaCO ₃ cement, moderate reaction with HCl; dry to very slightly moist; abrupt basal contact -----	70-73.5
Silty sand; sand--very fine to fine grained, fairly well sorted; moderate-yellowish-brown (10YR5/4); laminated, breaks into 15 mm thick lenses with CaCO ₃ cementing, very friable; moderately compacted, very friable, moderate to strong reaction with HCl; slightly moist -----	73.5-77.3
Pebbly silty sand with cobble; sand--very fine to very coarse grained, pebbles approximately 15% and \leq 60 mm, 1 cobble > 80 mm (cut by drilling), mostly subangular, very minor subrounded, very poorly sorted; sand--quartz, pebbles--quartzite, granite, cobble--banded quartzite; loose to moderately compacted, CaCO ₃ cementing, strong reaction with HCl; slightly moist; gradational basal contact -----	77.3-79.7
Silty sand; sand--very fine to fine grained, fairly well sorted; moderate-yellowish-brown (10YR5/4); laminated; moderately cemented with CaCO ₃ , very brittle/friable, blebs of caliche, moderate to strong reaction with HCl; very slightly moist -----	79.7-82
Sand; sand--predominantly very fine to fine grained with less medium grains, pebbles < 3% and \leq 50 mm, subangular to subrounded, poorly sorted; sand--quartz, pebbles--quartzite, granite, cherty limestone; dark-yellowish-brown (10YR4/2); loose to moderately compacted, CaCO ₃ cementing, moderate to strong reaction with HCl; moist; gradational basal contact -----	82-84
Clayey silty sand; sand--very fine to fine grained, fairly well sorted; moderate-yellowish-brown (10YR5/4) with dark-yellowish-brown (10YR4/2) clay blebs; moderately compacted, moderate to strong reaction with HCl; moist; abrupt basal contact -----	84-85
Sandy silt; sand--very fine to fine grained, pebbles < 2% and \leq 50 mm, subangular, well sorted matrix with scattered pebbles; pebbles--quartzite, banded quartzite, granodiorite; yellowish-gray (5Y7/2); loose, powdery, nodular, nodules cemented with CaCO ₃ , moderate to strong reaction with HCl; dry; gradational basal contact -----	85-88.3
Sand; sand--predominantly fine grained with < 5% medium to very coarse grains, gravel < 1% and \leq 70 mm, subrounded, fairly well sorted with 1 zone of poorly sorted near top and middle of section; sand--quartz, very minor feldspar, gravel--limestone, quartzite; moderate-yellowish-brown (10YR5/4); loose to slightly compacted, slight to moderate reaction with HCl; moist; gradational basal contact -----	88.3-92
Sand with pebbles; sand--very fine to very coarse grained, pebbles approximately 8% and \leq 60 mm, subangular to subrounded; sand--quartz, minor feldspar, pebbles--cherty limestone, quartzite; moderate-yellowish-brown (10YR5/4); loose with CaCO ₃ cemented lenses approximately 6 mm thick, moderate to strong reaction with HCl; dry to slightly moist; gradational basal contact -----	92-94.5
Sand; very fine to fine grained with minor medium to very coarse grains in lower 1.0 ft, subangular (lower 1 ft), fairly well sorted, poorly sorted in lower 1 ft; coarse sand in lower 1 ft--quartz, limestone; 94.5-95.9 ft--moderate-yellowish-brown (10YR5/4), 95.9-99.3 ft--light brown (5YR5/6), 99.3-100 ft--moderate-yellowish-brown (10YR5/4); minor clay in middle 3.4 ft section; moderately compacted, CaCO ₃ as veins, blebs, and cement, strong reaction with HCl; slightly moist to moist -----	94.5-100

LITHOLOGIC LOG

Area 5, Liquid Waste Disposal System - (LWDS-MW2)

Note: On 12-13AUG92 core was collected from 0' to 86' in a hole called LWDS-3. A new hole was started approximately 7' west of LWDS-3. The new hole was reamed to 89.6' where coring resumed on 06SEP92. The well location name was renamed LWDS-MW2. A third hole was started approximately 10' east of the original hole. The new hole was reamed to 116' where coring resumed on 17SEP92. Core was collected from 116' to 500'. Cuttings were collected by air-rotary drilling from 500' to 530'. Core was collected from 530' to 531' total depth.

Lithologies logged by U.S. Geological Survey geologists Cynthia Abeyta and Joe Szalona as follows:

<u>Depth</u>	<u>Date</u>	<u>Geologist</u>
0' to 86'	12AUG92 to 13AUG92	C. Abeyta
86' to 531'	06SEP92 to 21OCT92	J. Szalona

Percentage of hole logged by each geologist:

C. Abeyta	16%
J. Szalona	84%

Table 3.--Lithology penetrated by borehole LWDS-BH3

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Silty sand; sand--very fine to fine grained with minor medium grains, pebbles and cobbles < 1% and ≤ 65 mm, sand--subangular, pebbles and cobbles--subrounded, fairly well sorted, pebbles scattered and increase towards bottom of section; sand--quartz, minor feldspar, pebbles and cobbles--quartzite; 0-2.6 ft--moderate brown (5YR4/4), 2.6-7 ft--light brown (5YR5/6); root zones in upper 1 ft; 0-2.6 ft--loose to slightly compacted, 2.6-7 ft--loose and powdery, moderate to strong reaction with HCl; 0-2.6 ft--very moist (heavy overnight rain showers, approximately 2 inches rain), 2.6-7 ft--very slightly moist in upper 0.2 ft to dry; gradational basal contact -----	0-7
Pebbly sandy silt; sand--very fine to very coarse grained, pebbles approximately 20% and ≤ 63 mm, subangular, very poorly sorted; sand--quartz, minor feldspar and limestone, pebbles--quartzite, meta-granite, cherty limestone; matrix--very-pale-orange (10YR8/2); loose, powdery, moderate to strong reaction with HCl; slightly moist -----	7-10
Sand; sand--very fine to fine grained, pebbles < 0.5% and ≤ 40 mm, subrounded, well sorted; sand--quartz, minor mafics; moderate-yellowish-brown (10YR5/4); loose, scattered nodules with weak CaCO ₃ cementing, moderate to strong reaction with HCl; slightly moist; abrupt basal contact -----	10-11.5
Pebbly cobbly sand; sand--fine to very coarse grained, pebbles and cobbles approximately 25% and 2 to > 80 mm (fractured by drilling), subangular to subrounded, very poorly sorted; sand--quartz, minor limestone and feldspar, pebbles and cobbles--cherty limestone, greenstone, granodiorite; fine matrix--grayish orange (10YR7/4); loose, moderate reaction with HCl; dry; abrupt basal contact -----	11.5-15
Sand; sand--very fine to fine grained, pebbles < 0.5% and ≤ 10 mm, subangular, well sorted; sand--quartz, minor feldspar and mafics; moderate-yellowish-brown (10YR5/4); slightly compacted, moderate reaction with HCl; slightly moist -----	15-16
Pebbly cobbly sand; sand--very fine to very coarse grained, pebbles and cobbles approximately 25% and ≤ 80 mm and larger (broken up by drilling), one cobble > 110 mm, subangular to subrounded, very poorly sorted; sand--quartz, minor feldspar, pebbles and cobbles--quartzite, metagranite, cherty limestone, large cobble--quartzite; matrix--pale-yellowish-brown (10YR6/2); cobble > 110 mm struck in drill bit; loose, moderate to strong reaction with HCl; very slightly moist to dry -----	16-24
Sandy silt; sand--predominately very fine to fine grained with less medium to very coarse grains, pebbles < 3% and ≤ 38 mm, subangular to subrounded, very poorly sorted; sand--quartz, pebbles--greenstone; pale-yellowish-brown (10YR6/2); loose, powdery, strong reaction with HCl; dry -----	24-28
Cobbly pebbly sandy silt; sand--very fine to medium grained, upper 1.5 ft--very fine to very coarse grained, cobbles and pebbles approximately 25% in upper 1.5 ft decreasing towards bottom, pebbles and cobbles ≤ 65 mm, subangular, very poorly sorted; sand--quartz, pebbles and cobbles--quartzite; pale-yellowish-brown (10YR6/2); loose, powdery, moderate to strong reaction with HCl; dry -----	28-31

Table 3.--Lithology penetrated by borehole LWDS-BH3--Continued

Lithologic description	Depth interval below land surface (feet)
Silty sand with caliche; sand--predominantly very fine to fine grained with less medium grains, pebbles < 1% and \leq 60 mm, sand--subangular, pebbles--rounded to subrounded, pebbles scattered, fairly well sorted; sand--quartz, pebbles--quartzite, cherty limestone, one coarse-grained quartz sandstone clast; moderate-yellowish-brown (10YR5/4); mostly loose to slightly cemented with CaCO ₃ , CaCO ₃ as blebs, veins and as matrix, nodules of very fine to fine grained sand with CaCO ₃ cementing, moderate to strong reaction with HCl; dry to very slightly moist; gradational basal contact -----	31-38.5
Sandy silt with pebbles; sand--very fine to fine grained with less medium to very coarse grains, pebbles < 3-15% and \leq 55 mm, subangular to subrounded, very poorly sorted; sand--quartz, minor feldspar, pebbles--cherty limestone, greenstone, quartzite; very-pale-orange (10YR8/2); loose, powdery, strong reaction with HCl; dry; abrupt basal contact -----	38.5-39.5
Pebbly sand; sand--fine to very coarse grained, pebbles approximately 15% and \leq 18 mm, subangular to subrounded, very poorly sorted; sand--quartz, feldspar, pebbles--limestone, granite; fine matrix--moderate-yellowish-brown (10YR5/4); loose, moderate reaction with HCl; dry; gradational basal contact -----	39.5-40.4
Silty sand; sand--very fine to fine grained, well sorted, nodular; moderate-yellowish-brown (10YR5/4); nodules and lenses \leq 30 mm thick; slightly compacted to loose, CaCO ₃ cemented, moderate reaction with HCl; very slightly moist; abrupt basal contact.-----	40.4-44.2
Cobbly pebbly silty sand; sand--very fine to very coarse grained, cobbles and pebbles approximately 30%, subangular to subrounded, very poorly sorted; sand--quartz, feldspar, limestone, cobbles and pebbles--limestone, granite, quartzite; matrix--moderate-yellowish-brown (10YR5/4); less sand and gravel and more silt towards bottom; loose, strong reaction with HCl; dry-----	44.2-46
Cobbly pebbly sandy silt; sand--very fine to fine grained with less medium to very coarse grains, cobbles and pebbles 20-30% and \leq 70 mm, sand--subangular, pebbles--subrounded to rounded, very poorly sorted; sand--quartz, minor feldspar, limestone, cobbles and pebbles--cherty limestone, quartzite, metagranite; very-pale-orange (10YR8/2); loose, powdery, strong reaction with HCl; dry; gradational basal contact -----	46-51
Cobbly pebbly sand; sand--fine to medium grained with less coarse to very coarse grains, pebbles and cobbles 3-20% and \leq 80 mm, sand--subangular, pebbles and cobbles--subangular to subrounded; sand--arkosic, cobbles and pebbles--quartzite, limestone, granite, greenstone; moderate-yellowish-brown (10YR5/4); loose, moderate reaction with HCl; very slightly moist to dry; gradational basal contact.-----	51-56.5
Pebbly sandy silt; sand--very fine to very coarse grained, pebbles approximately 30% and \leq 52 mm, predominantly 8-12 mm, cobbles from 58-60 ft < 80 mm and one > 90 mm, angular, subangular, and subrounded, fairly well sorted from 56.5-57 ft, otherwise poorly sorted; sand--arkosic, pebbles--quartzite, granite, greenstone, cobbles--greenstone, quartzite; pale-yellowish-brown (10YR6/2); loose, powdery, strong to moderate reaction with HCl; dry; abrupt basal contact.-----	56.5-60
Sand; very fine to fine grained, minor coarse grains, subangular, well sorted; coarse grained sand--quartz, feldspar; moderate-yellowish-brown (10YR5/4); moderately cemented with CaCO ₃ , moderate to strong reaction with HCl; very slightly moist-----	60-61.5

Table 3.--Lithology penetrated by borehole LWDS-BH3--Concluded

Lithologic description	Depth interval below land surface (feet)
Cobbly pebbly sandy silt; sand--very fine to very coarse grained, cobbles and pebbles approximately \leq 30% and \leq 70 mm, predominantly \leq 15 mm, angular to subangular, few subrounded, poorly sorted; sand--quartz, feldspar, cobbles and pebbles--quartzite, cherty limestone; grayish orange (10YR7/4); CaCO ₃ cemented in upper 0.5 ft, friable into fine powder with pebbles, otherwise loose, powdery, moderate to strong reaction with HCl; dry; gradational basal contact -----	61.5-63.2
Sand; very fine to fine grained, well sorted; moderate-yellowish-brown (10YR5/4); slightly compacted / cemented with CaCO ₃ , caliche as blebs and cement, moderate to strong reaction with HCl; slightly moist; gradational basal contact -----	63.2-65.2
Silty pebbly sand; sand--very fine to very coarse grained, pebbles approximately 20% and 4 to 10 mm, one cobble > 80 mm (fractured by drilling), subangular, few subrounded, very poorly sorted; sand--arkosic, pebbles--quartzite, granite, cobble--quartzite with iron stains; pale-yellowish-brown (10YR6/2); loose, powdery, strong reaction with HCl; slightly moist to dry; gradational basal contact -----	65.2-67.5
Cobbly pebbly sandy silt; sand--very fine to very coarse grained, cobbles and pebbles approximately 15% and \leq 65 mm, predominantly 4 to 10 mm, one 150 mm cobble, subangular, few subrounded, very poorly sorted; sand--arkosic, quartz, limestone, cobbles and pebbles--quartzite, limestone, metagranite, greenstone, cherty limestone, large cobble--banded quartzite; very-pale-orange (10YR8/2); loose, powdery, some CaCO ₃ cemented lenses, strong reaction with HCl; dry -----	67.5-71
No recovery -----	71-76
Silty sand; sand--very fine to fine grained with approximately 5% medium to very coarse grains, pebbles < 5% and \leq 50 mm, subangular to subrounded, very poorly sorted; pale-yellowish-brown (10YR6/2); loose, powdery, strong reaction with HCl; dry; abrupt basal contact -----	76-77.5
Sand with clay; sand--very fine to fine grained, well sorted; sand matrix--moderate-yellowish-brown (10YR5/4), clay--moderate brown (5YR4/4); clay absent in some zones and as blebs and matrix in other zones; moderately compacted but friable, moderate reaction with HCl; slightly moist -----	77.5-86
No recovery -----	86-96

Table 4.--Lithology penetrated by borehole LWDS-BH4

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Silty sand; sand--very fine to fine grained, 7-18.7 ft sand is very fine to medium grained, pebbles < 1% and < 15 mm, 2 cobbles < 100 mm (fractured by drilling), subangular to subrounded; pebbles--granite, limestone, quartzite; moderate brown (5YR4/4), 1.9-7 ft--light brown (5YR6/4); upper 1 ft contains plant roots; moderately compacted, 7-18.7 ft--loose to moderately cemented, CaCO ₃ cement, caliche as matrix in zones below 7 ft, 0-1.9 ft--slight reaction with HCl, 1.9-18.7 ft--strong reaction with HCl; moist, 1.9-7 ft--slightly moist; abrupt contact at 1.9 ft due to cobbles and change in moisture -----	0-18.7
Pebbly silty sand with cobbles; sand--very fine to very coarse grained, pebbles and cobbles < 80 mm, pebbles and cobbles--mostly subangular, very poorly sorted; sand--quartz, feldspar, limestone, pebbles and cobbles--limestone, quartzite; moderate-yellowish-brown (10YR5/4); loose, strong reaction with HCl; moderately moist -----	18.7-22.5
Silty sand with clay; sand--very fine to medium grained; moderate-yellowish-brown (10YR5/4); clayey in upper section, more silty in lower section; loose to moderately cemented, strong reaction with HCl; moist -----	22.5-25
Pebbly silty sand; sand--very fine to medium grained, pebbles approximately 20% and < 60 mm, five cobbles > 70-80 mm (fractured by drilling), subangular, poorly sorted; pebbles and cobble--quartzite, limestone; 25-35 ft--moderate-yellowish-brown (10YR5/4), 35-40 ft--light brown (5YR6/4); loose, 27-35 ft includes powdery zone with high caliche content, strong reaction with HCl; slightly to moderately moist -----	25-40
Silty sand with pebbles; sand--very fine to fine grained, pebbles < 8% and ≤ 60 mm, predominately < 30 mm, subangular, poorly sorted; pebbles--limestone, quartzite; light brown (5YR6/4); loose, especially in upper and lower sections where silty; slightly to moderately moist -----	40-44.6
Sand with silt; sand--very fine to medium grained, with mostly medium grains in upper section, pebbles < 2% and < 40 mm, subangular, well sorted; pebbles--limestone; dark-yellowish-orange (10YR6/6); slightly to moderately cemented with CaCO ₃ , strong reaction with HCl; moderately moist -----	44.6-47
Pebbly silty sand with caliche and cobbles; sand--very fine to fine grained, pebbles ≤ 20%, cobbles ≤ 15% decreasing to < 1% at 57 to 62 ft, pebbles and cobbles and ≤ 100 mm (fractured by drilling), subangular, few subrounded, poorly sorted; pebbles and cobbles--quartzite, limestone, minor greenstone; 47-54 ft--moderate-yellowish-brown (10YR5/4), 54-57 ft--grayish orange (10YR7/4), 57-62 ft--pale-yellowish-brown (10YR6/2); loose to powdery, caliche as matrix, strong reaction with HCl; slightly to moderately moist -----	47-62
Silty sand with pebbles; sand--very fine to fine grained, pebbles < 12% and < 40 mm, predominately < 20 mm, subangular, poorly sorted; pale-yellowish-brown (10YR6/2); loose to powdery, strong reaction with HCl; slightly to moderately moist -----	62-64.6

Table 4.--Lithology penetrated by borehole LWDS-BH4--Concluded

Lithologic description	Depth interval below land surface (feet)
Pebbly silty sand; sand--very fine to very coarse grained, pebbles 20%, one 70 mm cobble, subangular to subrounded, poorly sorted; sand--arkose, pebbles--granite, quartzite, limestone; moderate-yellowish-brown (10YR5/4); basal 0.1 ft is finer grained sand showing irregular near horizontal laminations; loose, strong reaction with HCl; slightly to moderately moist -----	64.6-66
Sandy silt and silty sand; sand--very fine to fine grained, pebbles < 4% and < 25 mm, predominately < 10 mm, subangular to subrounded; pebbles--limestone, quartzite, metagranite; grayish-orange-pink (5YR7/2); loose to powdery, strong reaction with HCl; slightly to moderately moist; abrupt basal contact -	66-68.8
Silty sand with caliche; sand--very fine to medium grained, well sorted; moderate-yellowish-brown (10YR 5/4); poorly laminated; moderately compacted, weakly to moderately cemented with CaCO ₃ , caliche scattered as blebs, strong reaction with HCl; moderately moist -----	68.8-74.2
Pebbly silty sand; sand--very fine to fine grained, pebbles 15-25% and ≤ 60 mm, one cobble--80 mm (broken by drilling) between 74.2-75 ft, subangular; pebbles--limestone, quartzite; 74.2-75 ft--grayish-orange-pink (5YR7/2), 75-76.2 ft--pale-yellowish-brown (10YR 6/2); loose to powdery, strong reaction with HCl; slightly to moderately moist; abrupt basal contact -----	74.2-76.2
Silty sand; sand--very fine to medium grained, pebbles < 1% and < 10 mm, one clast 30 mm, subangular to subrounded; pebbles--limestone; light brown (5YR6/4); poorly laminated, moderately compacted, slightly to moderately cemented with CaCO ₃ , strong reaction with HCl; slightly to moderately moist -----	76.2-83
Pebbly silty sand; sand--very fine to fine grained with medium grains from 86-94 ft, pebbles 15-25% and ≤ 60 mm, predominately < 30 mm, one cobble between 83-86 ft, pebbles and cobble--subangular, few subrounded; pebbles--quartzite, limestone, cobble--limestone; 83-86 ft--moderate-yellowish-brown (10YR5/4), 86-94 ft--light brown (5YR6/4); loose to weakly cemented where sandy, CaCO ₃ cement, strong reaction with HCl; slightly to moderately moist where sandy -----	83-94
Sandy silt and silty sand; sand--very fine to medium grained; grayish-orange-pink (5YR7/2); sand also occurs as lens; powdery, sand lens moderately cemented with CaCO ₃ , strong reaction with HCl; slightly to moderately moist -----	94-95
Silty sand with pebbles and cobbles; sand--very fine to very coarse grained, pebbles 10%, cobbles ≤ 4% and ≤ 75 mm, subangular; pebbles and cobbles--limestone; light brown (5YR6/4); loose, medium grained sand zones weakly cemented with CaCO ₃ , strong reaction with HCl; slightly to moderately moist -----	95-100

Table 5.--Lithology penetrated by borehole LWDS-BH5

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Silty sand and caliche; sand--very fine to fine grained, 1 cobble > 90 mm at bottom of section, well sorted; cobble--metagranite/quartzite; 0-0.9 ft--moderate brown (5YR4/4), 0.9-12.6 ft--moderate-yellowish-brown (10YR5/4); upper 0.9 ft contains numerous roots; loose to weakly cemented, CaCO ₃ cement, caliche abundant as matrix and blebs and decreasing towards bottom, nodule zones with CaCO ₃ cementing, strong reaction with HCl; 0-0.9 ft--moist, 0.9-12.6 ft--dry to very slightly moist; gradational basal contact -----	0-12.6
Sandy silt; sand--very fine to fine grained with medium to very coarse grains, pebbles < 2% and ≤ 50 mm, one cobble broken up by drilling, moderately sorted, angular to subangular, poorly sorted; sand--quartz, feldspar, red sandstone, pebbles--metagranite, limestone, cobble--metagranite/quartzite; yellowish gray (5Y7/2); loose, powdery, moderate reaction with HCl; dry; gradational basal contact -----	12.6-15
Sand with pebbles; sand--fine grained with < 1% medium to very coarse grains, pebbles < 1% and ≤ 20 mm, angular to subangular, well sorted; sand--quartz, minor mafics, pebbles--quartzite, metaquartzite; moderate-yellowish-brown (10YR5/4); moderately compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; slightly moist -----	15-16
Silty sand with pebbles and cobble; sand--very fine to very coarse grained, pebbles ≤ 5% and ≤ 50 mm, pebbles scattered and decreasing toward bottom, cobbles > 90 mm, subangular, poorly to moderately sorted towards bottom; sand--quartz, minor feldspar, biotite and muscovite, pebbles--quartzite, limestone, cobbles--limestone, quartzite; 16-17.8 ft--pale-yellowish-brown (10YR6/2), 17.8-35 ft--moderate-yellowish-brown (10YR5/4); 16-17.8 ft--loose, 17.8-35 ft--loose to moderately compacted/cemented, CaCO ₃ cement, lenticular, minor clay, from 16-21 ft, caliche very abundant in matrix and blebs towards bottom, moderate to strong reaction with HCl; dry to slightly moist -----	16-35
Pebbly silty sand; sand--very fine to very coarse grained, pebbles approximately 15% and ≤ 63 mm, 35-37 ft--cobbles > 90 mm, subangular with minor subrounded, poorly sorted; sand--quartz, minor feldspar, limestone, and biotite, pebbles and cobbles--limestone, quartzite, greenstone, granodiorite, metagranite; pale-yellowish-brown (10YR6/2); loose with zones of compaction/cementing, cemented zones weakly to moderately cemented with CaCO ₃ , moderate to strong reaction with HCl; abrupt basal contact; dry -----	35-49
Sand (clast); medium grained, angular to subangular, well sorted; sand--quartz; FeO ₂ stain--reddish orange (not colored on chart); strongly cemented, CaCO ₃ and SiO ₂ cementing, moderate reaction with HCl; dry -----	49-50
Silty sand; sand--very fine to fine grained, fairly well sorted; moderate-yellowish-brown (10YR5/4); moderately cemented with CaCO ₃ ; dry; gradational basal contact -----	50-51.5
Pebbly silty sand; sand--very fine to very coarse grained, pebbles approximately 20% and ≤ 60 mm, subangular, poorly sorted; sand--quartz, feldspar, greenstone, pebbles--granite, metagranite, quartzite; moderate-yellowish-brown (10YR5/4); loose, moderate to strong reaction with HCl; dry; gradational basal contact -----	51.5-52.7

Table 5.--Lithology penetrated by borehole LWDS-BH5--Continued

Lithologic description	Depth interval below land surface (feet)
Silty sand; sand--very fine to fine grained, fairly well sorted; moderate-yellowish-brown (10YR5/4); moderately cemented with CaCO ₃ ; dry -----	52.7-54
Pebbly silty sand with cobbles; sand--very fine to very coarse grained, pebbles approximately 20% and ≤ 63 mm, cobbles 70 mm to > 90 mm, angular to subangular, very poorly sorted; sand--quartz, minor feldspar and limestone, pebbles and cobbles--quartzite; moderate-yellowish-brown (10YR5/4); loose, strong reaction with HCl; slightly moist; gradational basal contact -----	54-56.3
Sand; medium grained with minor very coarse grains, angular to subangular, well sorted; quartz; loose, moderate reaction with HCl; very moist; gradational basal contact -----	56.3-57.7
Pebbly silty sand; sand--very fine to very coarse grained, pebbles approximately 15% and ≤ 25 mm, angular to subangular, poorly sorted; sand--quartz, minor feldspar, limestone, mafics, pebbles--quartzite, limestone, red sandstone; moderate-yellowish-brown (10YR5/4); loose, moderate reaction with HCl; slightly moist -----	57.7-60
Silty sand; sand--very fine to fine grained, very fine to very coarse grained and pebbles ≤ 5% and < 50 mm from 60-62.3 ft, 1.2 ft sandy silt zone with < 5% medium to very coarse grains and < 5% cobbles > 90 mm (fractured during drilling) at 73 ft, coarser grains--subangular, well sorted, poorly sorted in pebbly and sandy silt zones; sand--quartz, minor feldspar and mafics, pebbles--metagranite, quartzite, shale, cobbles--limestone; moderate-yellowish-brown (10YR5/4), sandy silt zone--pale-yellowish-brown (10YR6/2); minor clay from approximately 61.4-62.3 ft; moderately cemented with CaCO ₃ , sandy silt zone--loose and powdery, moderate to strong reaction with HCl; slightly moist to dry -----	60-77
Silty pebbly sand; sand--very fine to very coarse grained, pebbles approximately 15% and ≤ 60 mm, subangular, minor subrounded, poorly sorted; sand--quartz, minor feldspar and biotite, pebbles--limestone, quartzite; moderate-yellowish-brown (10YR5/4); loose, with zones of moderate CaCO ₃ cementing, moderate to strong reaction with HCl; very slightly moist; gradational basal contact -----	77-81.3
Silty sand; sand--81.3-87 ft is very fine to fine grained, well sorted, 87.3-89.5 ft is very fine to very coarse grained with pebbles and cobbles approximately 3% and ≤ 70 mm, subangular, very poorly sorted, becomes siltier towards bottom; sand--quartz, biotite, minor feldspar, pebbles and cobbles--metagranite, quartzite; light brown (5YR5/6) at top to grayish orange (10YR7/4) towards 87.3 ft, 87.3-89.5 ft--pale-yellowish-brown (10YR6/2); moderately cemented with CaCO ₃ to loose from 87.3-89.5 ft with some CaCO ₃ cemented zones, caliche abundant in matrix and as blebs in lower 2.1 ft, moderate to strong reaction with HCl; very slightly moist; abrupt basal contact -----	81.3-89.5

Table 5.--Lithology penetrated by borehole LWDS-BH5--Concluded

Lithologic description	Depth interval below land surface (feet)
Silty sand with clay zone; sand--very fine to fine grained, < 0.5% very coarse grains, subangular, fairly well sorted; sand--predominantly quartz, with feldspar and biotite; becomes clayey within 1.4-2.8 ft from top of section; moderate-yellowish-brown (10YR5/4), clay zone--moderate brown (5YR4/4); moderately cemented with CaCO ₃ , moderately compacted at clay zone but also contains CaCO ₃ cementing, strong reaction with HCl; moist; gradational basal contact -----	89.5-93.5
Pebbly silty sand with cobbles; sand--very fine to very coarse grained, pebbles and cobbles--approximately 20% and ≤ 75 mm, subangular, very poorly sorted; sand--predominately quartz, less feldspar and biotite, pebbles and cobbles--metagranite, quartzite; moderate-yellowish-brown (10YR5/4); becomes siltier towards bottom of section; loose, moderate to strong reaction with HCl; very slightly moist; gradational basal contact -----	93.5-96.3
Silty sand; sand--very fine to fine grained, < 0.5% medium to very coarse grains, subangular, fairly well sorted; sand--predominately quartz with feldspar and biotite; moderate brown (5YR4/4); moderately cemented with CaCO ₃ , caliche as matrix and blebs in lower 1.5, moderate to strong reaction with HCl; slightly moist -----	96.3-100

C. Abeyta	100%
-----------	------

Table 6.--Lithology penetrated by borehole LWDS-BH6

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥ greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Landscape gravel -----	0-0.3
Silty sand; sand--very fine to fine grained with < 5% medium to very coarse grains, sand zones at 14.6-16.5 ft and 18.3- 19.4 ft where sand is medium grained, pebbles < 1% and ≤ 50 mm, pebbles also in sand zones, coarse grained sand--subangular to subrounded, pebbles--subangular to rounded, three cobbles--one 80 mm (between 0.3-12.1 ft), and two > 90 mm (fractured by drilling) (between 22.5-22.9 ft), fairly well to moderately sorted; sand--arkose; sand zones--quartz with minor feldspar and mafics, pebbles--quartzite, limestone, granite, basalt, cobbles--one limestone, two quartzite; 0.3-20.8 ft--moderate-yellowish-brown (10YR5/4), 19.4-20.8 ft--light brown (5YR6/4), 20.8-22.5 ft--moderate-yellowish-brown (10YR5/4) to grayish orange (10YR7/4), 22.5-22.9 ft--dark-yellowish-brown (10YR4/2); 0.3-20.8 ft--loose, 20.8-22.9 ft--moderately compacted/cemented, CaCO ₃ cement, moderate to strong reaction with HCl, sand zones have no to very slight reaction with HCl; moist; gradational contact at 14.6 ft (top of first sand zone), abrupt contacts at 18.3 ft and 19.4 ft (top and bottom of 2nd sand zone), abrupt basal contact-----	0.3-22.9
Silty pebbly sand; sand--very fine to very coarse grained, pebbles approximately 20%, cobbles < 1%, sand--subangular, pebbles--subangular to rounded, cobbles--fractured by drilling, very poorly sorted; sand--quartz, minor feldspar, pebbles--limestone, quartzite, metagranite, cobbles--limestone, quartzite; pinkish gray (5YR8/1); loose, powdery, moderate to strong reaction with HCl; dry; abrupt basal contact-----	22.9-25.1
Sand; sand--very fine to fine grained, well sorted; sand--quartz, minor feldspar and mafics; moderate-yellowish-brown (10YR5/4); weakly cemented with CaCO ₃ , moderate to strong reaction with HCl; moist-----	25.1-27.3
Sand with silt; sand--very fine to fine grained with < 5% medium to very coarse grains, pebbles < 2% and 4 mm to 45 mm, sand--subangular, pebbles--angular, subangular, rounded, poorly sorted; sand--quartz, minor feldspar and mafics, pebbles--quartzite, limestone, granite, cobble--greenstone/quartzite; moderate-yellowish-brown (10YR5/4); moderately compacted/cemented, CaCO ₃ cement, moderate to strong reaction with HCl; moist; gradational basal contact -----	27.3-30.5
Pebbly silty sand; sand--very fine to very coarse grained, pebbles approximately 15% and ≤ 63 mm, cobbles approximately 1% and 63 mm to > 90 mm (fractured by drilling), sand--subangular to subrounded, pebbles--subangular to rounded, cobbles--subangular to angular (angular due to fracturing by drilling), very poorly sorted; sand--quartz, feldspar, biotite, pebbles--limestone, quartzite, granite, decomposing granite, cobbles--quartzite, decomposing granite; pale-yellowish-brown (10YR6/2) at top to moderate-yellowish-brown (10YR5/4) in middle to pinkish gray (5YR8/1) at bottom; grayish olive (10Y4/2) coating on quartzite cobble near 46 ft, also moderate red (5R4/6) FeO ₂ stain on decomposing gravel between 46 ft and 47 ft; loose to moderately cemented with CaCO ₃ , moderate to strong reaction with HCl; moist at top to slightly moist towards middle to dry at bottom-----	30.5-43.3

See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Asphalt -----	0-0.4
Silty sand ; sand--very fine to fine grained with < 5% medium to very coarse grains, pebbles < 2% and ≤ 40 mm, cobble > 130 mm in length at 4.3 ft, sand--subangular, pebbles--subrounded to rounded, one 60 mm iron (metallic) clast at 1.7-4.3 ft, well to moderately sorted; sand--arkose, pebbles--limestone, quartzite, shale, basalt, cobble--pegmatite; moderate-yellowish-brown (10YR5/4); white precipitate and olive gray (5Y3/2) material mixed with quartz sand at approximately 3.9 ft, 0.5 ft pebbly sand zone near 9.5 ft with very fine to very coarse grained sand, pebbles approximately 35% and < 6 mm with < 1% 25 mm to 70 mm and pale-yellowish-brown (10YR6/2); slightly compacted at top to moderately compacted/cemented and friable towards bottom, CaCO ₃ cement, pebble zone--loose, moderate to strong reaction with HCl, pebble zone--slight to no reaction with HCl; moist, pebble zone--slightly moist, pebble zone has abrupt upper and basal contact, gradational basal contact -----	0.4-22.5
Pebbly sand with silt ; sand--very fine to very coarse grained, pebbles approximately 20% and < 10 mm, < 1% 20 mm to 63 mm, angular to subrounded, very poorly sorted; sand--quartz, minor feldspar and mafics, pebbles--quartzite, granite, basalt, limestone, shale; moderate-yellowish-brown (10YR5/4); loose to moderately compacted/cemented with CaCO ₃ cement, slight to strong reaction with HCl; slightly moist to moist -----	22.5-25.1
Silty sand with pebbles ; sand--very fine to fine grained with < 3% medium to very coarse grains, pebbles < 3% and ≤ 20 mm, subangular to subrounded, some pebbles rounded, poorly to moderately well sorted; moderate-yellowish-brown (10YR5/4); pebble content decreases towards bottom of section and becomes moderately well sorted; moderately compacted/cemented, CaCO ₃ cement, moderate to strong reaction with HCl; moist; abrupt basal contact -----	25.1-27.7
Not described -----	27.7-37.2

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Asphalt -----	0-0.4
Silty sand ; sand--very fine to fine grained with < 5% medium to very coarse grains, pebbles < 3% and ≤ 63 mm, predominately < 35 mm, 3.4-8.5 ft zone included two cobbles--one 80 mm and one > 90 mm, sand--subangular, pebbles--subrounded to rounded, cobbles--subrounded, fractured (due to drilling), fairly well to moderately sorted; sand--arkose, pebbles--quartzite, granite, limestone, fossiliferous limestone, basalt, cobbles--one is limestone, one is quartzite; moderate-yellowish-brown (10YR5/4); compacted, moderate to strong reaction with HCl; moist; gradational basal contact -----	0.4-8.5
Sand ; very fine to fine grained, well sorted; moderate-yellowish-brown (10YR5/4) to light brown (5YR5/6); moderately compacted, moderate reaction with HCl; moist; gradational basal contact -----	8.5-11
Silty sand ; sand--very fine to fine grained with < 5% medium to very coarse grains, pebbles ≤ 5% and ≤ 40 mm, pebble content decreases to < 0.5% towards bottom, sand--subangular, pebbles--subangular to subrounded, poorly sorted at top to moderately sorted towards bottom; sand--quartz, feldspar, limestone, greenstone, pebbles--limestone, greenstone, quartzite, feldspar; 11-14 ft--pale-yellowish-brown (10YR6/2), 14-23 ft--moderate-yellowish-brown (10YR5/4); minor clay present in matrix from 19.9-20.4 ft; loose to moderately cemented with CaCO ₃ ; moderate to strong reaction with HCl; moist; gradational basal contact -----	11-23
Pebbly silty sand ; sand--very fine to very coarse grained, pebbles approximately 20% and ≤ 63 mm, cobbles < 1% and 80 mm, sand and pebbles--angular to subangular, cobbles--subangular to subrounded, very poorly sorted; sand--arkose, limestone, pebbles--quartzite, limestone, cobbles--quartzite, granite, metagranite, limestone; pale-yellowish-brown (10YR6/2); loose, moderate to strong reaction with HCl; very slightly moist -----	23-28.9
Silty sand with clay ; sand--very fine to fine grained with approximately 5% medium to very coarse grains, pebbles approximately 3% and predominately 2 to 6 mm, < 0.5% 6-20 mm, and one 50 mm, poorly sorted; sand--arkose, pebbles--quartzite, feldspar, limestone; moderate-yellowish-brown (10YR5/4); clay in matrix, decomposing pebbles; moderately to strongly compacted and cemented with CaCO ₃ , moderate to strong reaction with HCl; slightly moist; gradational basal contact -----	28.9-31

Table 8.--Lithology penetrated by borehole LWDS-BH8--Concluded

Lithologic description	Depth interval below land surface (feet)
<p>Pebbly silty sand; sand--very fine to very coarse grained, pebbles $\leq 20\%$ and ≤ 60 mm, cobbles approximately 1% and 63 mm to > 90 mm, sand--subangular, pebbles--angular to subrounded, cobbles--subangular (fractured by drilling), very poorly sorted; sand--quartz, feldspar, biotite, limestone, pebbles and cobbles--quartzite, limestone, granite, greenstone; 31-33.2 ft--pale-yellowish-brown (10YR6/2) with an abrupt color change to pale-reddish-brown (10R5/4) at approximately 32 ft, 33.2-36.6 ft--pale-yellowish-brown (10YR6/2); 31-33.2 ft--loose/powdery, 33.2-36.6 ft--strongly cemented with CaCO_3 to loose, strong reaction with HCl; dry to very slightly moist -----</p>	31-36.6
<p>Silty sand with pebbles and cobbles; sand--very fine to fine grained with approximately 8% medium to very coarse grains, pebbles approximately 10% and 2 mm to 60 mm, cobbles $< 1\%$ and 80 mm to > 90 mm, sand--subangular, pebbles--angular to subrounded, cobbles--subangular to angular (due to fracturing by drilling), very poorly sorted; sand--quartz, less feldspar, limestone and mafics, pebbles--quartzite, metagranite, limestone, cobbles--limestone, quartzite; pale-yellowish-brown (10YR6/2); loose, powdery, strong reaction with HCl, moderately cemented clasts, CaCO_3 cement; very slightly moist-----</p>	36.6-40.8
<p>Pebbly sandy silt; sand--very fine to fine grained with $< 5\%$ medium to very coarse grains, pebbles approximately 15% and 2 mm to 50 mm, subangular, very poorly sorted; sand--quartz, minor feldspar, pebbles--limestone, quartzite, metagranite; very-pale-orange 10YR8/2; becomes more sandy and pebbly in lower 0.7'; loose, powdery, some CaCO_3 cemented clasts, strong reaction with HCl; dry -----</p>	40.8-42.5

LITHOLOGIC LOG

Area 5, Liquid Waste Disposal System - (LWDS-MW1)

Note: Cuttings were collected from a vertical hole drilled by a gasoline motorized hand auger from 0' to 4'. Core was collected from 4' to 385'. Cuttings were collected by air-rotary drilling from 385' to 390'. Core was collected from 390' to 525'. On 03SEP92, during drilling of the 169'-170' interval, the drill bit met resistance on a boulder and could not penetrate any further; the hole TD'ed at 169'. Drilling resumed on a new hole adjacent to first hole on 02APR93. The new hole was drilled to 160' where coring resumed.

Lithologies logged by U.S. Geological Survey geologists Cynthia Abeyta and Joe Szalona as follows:

<u>Depth</u>	<u>Date</u>	<u>Geologist</u>
0' to 60'	22AUG92	C. Abeyta
60' to 169'	23AUG92 to 02SEP92	J. Szalona
160' to 171'	05APR93 to 05APR93	J. Szalona
171' to 187'	05APR93 to 06APR93	C. Abeyta
187' to 217'	08APR93	J. Szalona
217' to 243'	13APR93	C. Abeyta
243' to 314'	14APR93 to 17APR93	J. Szalona
314' to 330'	18APR93	C. Abeyta
330' to 525'	19APR93 to 02MAY93	J. Szalona

Percentage of hole logged by each geologist:

J. Szalona	78%
C. Abeyta	22%

Table 9.--Lithology penetrated by borehole LWDS-MW1

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥ greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval below land surface (feet)
Asphalt -----	0-0.15
Sand (fill material); sand--fine to medium grained, minor coarse to very coarse grains, pebbles approximately 4% and ≤ 40 mm from 0.15-3.85 ft, sand--subangular to subrounded, pebbles--angular to subangular, fairly well sorted from 4-5 ft; sand--arkosic, pebbles--quartzite, limestone; moderate-yellowish-brown (10 YR5/4); loose to slightly compacted in lower 1 ft, weak to moderate reaction with HCl; slightly moist; gradational basal contact -----	0.15-7.5
Cobbly, pebbly sand; sand--fine to very coarse grained, cobbles and pebbles approximately 20%, pebbles ≤ 63 mm, cobbles > 90 mm (fractured by drilling), subangular to subrounded, very poorly sorted; sand--arkosic, limestone, pebbles and cobbles--limestone, quartzite, granite; moderate-yellowish-brown (10 YR5/4); loose, strong to moderate reaction with HCl; slightly moist; abrupt basal contact -----	7.5-13.5
Sand; sand--very fine to fine grained, one cobble > 90 mm at bottom of core (fractured by drilling), well sorted; sand--quartz, minor feldspar and biotite, cobble--metagranite/quartzite and greenstone (schist or phyllite); moderate-yellowish-brown (10 YR5/4); moderate brown (5YR4/4) clay bound on cobble; weakly to moderately cemented with CaCO ₃ , moderate to strong reaction with HCl; slightly moist -----	13.5-17
Clayey sand; sand--very fine to fine grained, well sorted; moderate-yellowish-brown (10 YR5/4); compacted, caliche as matrix and blebs, moderate reaction with HCl; moist (partially due to decontamination wash of core barrel); gradational basal contact -----	17-17.5
Sand and caliche; sand--very fine to fine grained; minor silt, pebbles approximately 3% and ≤ 15 mm, 1 cobble > 85 mm (fractured by drilling), moderately to poorly sorted; sand--quartz, minor feldspar and mafics, pebbles--granite, quartzite, limestone, cobble--quartzite; moderately compacted/cemented with CaCO ₃ and minor clay, caliche as matrix, veins, and blebs, moderate to strong reaction with HCl; slightly moist; abrupt basal contact -----	17.5-21.9
Silty sand with pebbles and cobbles; sand--very fine to very coarse grained, pebbles approximately 10-15% and ≤ 63 mm, cobbles approximately 1% and ≤ 75 mm (fractured during drilling), sand--subangular, pebbles and cobbles--subangular to subrounded, poorly sorted; sand--quartz, limestone, minor feldspar, pebbles and cobbles--crystalline limestone, metagranite, quartzite, fossiliferous limestone; pale-yellowish-brown (10YR6/2) at top to moderate-yellowish-brown (10 YR5/4) at bottom; siltier at top with increasing sand towards bottom, cobbles scattered throughout; loose, powdery at top, moderate to strong reaction with HCl in upper 1 ft to weak to moderate reaction with HCl in lower 3 ft; dry -----	21.9-30
Sandy silt; sand--very fine to fine grained with < 3% medium to very coarse grains, pebbles < 3% and ≤ 50 mm, subangular to subrounded, poorly sorted; sand--quartzite, limestone, pebbles--metagranite, fossiliferous and cherty limestone; pale-yellowish-brown (10YR6/2); sandier towards bottom; loose, powdery, moderate to strong reaction with HCl; dry; gradational basal contact -----	30-32.5

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Silty sand with caliche ; sand--very fine to fine grained, well sorted; moderate-yellowish-brown (10 YR5/4); loose to moderately cemented with CaCO ₃ , caliche as blebs and matrix, moderate to strong reaction with HCl; very slightly moist; gradational basal contact -----	32.5-35
Silty sand with caliche ; sand--very fine to fine grained, well sorted; moderate-yellowish-brown (10 YR5/4); loose to moderately cemented with CaCO ₃ , caliche as blebs and matrix, moderate to strong reaction with HCl; very slightly moist; gradational basal contact -----	32.5-35
Gravelly silty sand ; sand--very fine to fine grained with approximately 7% medium to very coarse grains, pebbles approximately 15% and ≤ 73 mm, 1 cobble--85 mm, mostly subangular, some subrounded, poorly sorted; sand--quartz, limestone, minor greenstone and feldspar, pebbles--granite, metagranite, limestone, quartzite, 85 mm cobble--greenstone; moderate-yellowish-brown (10 YR5/4); loose, moderate to strong reaction with HCl; dry; gradational basal contact -----	35-40
Sand with pebbles ; sand--very fine to fine grained with < 3% medium to very coarse grains, pebbles < 8% and ≤ 48 mm, subangular, poorly sorted; sand--quartz, minor feldspar, pebbles--quartzite, limestone; moderate-yellowish-brown (10 YR5/4); loose to moderately cemented with CaCO ₃ , weak to moderate reaction with HCl -----	40-42
Pebbly sandy silt ; sand--very fine to fine grained with < 5% medium to very coarse grains, pebbles approximately 15% and ≤ 50 mm, subangular, poorly sorted; sand--quartz, feldspar, limestone, mafics, pebbles--limestone, granite, quartzite; pale-yellowish-brown (10YR6/2); loose, powdery, moderate reaction with HCl; dry; abrupt basal contact -----	42-44
Silty sand with pebbles ; sand--very fine to fine grained with < 3% medium to very coarse grains, pebbles < 5% and ≤ 50 mm, cobble > 90 mm, sand--subangular, pebbles--subangular to subrounded, moderately to poorly sorted; sand--quartz, minor feldspar, pebbles--granite, quartzite, metagranite, cobble--quartzite; moderate-yellowish-brown (10 YR5/4); loose to moderately compacted/cemented, CaCO ₃ cement, moderate reaction with HCl; dry -----	44-47
Pebbly sandy silt ; sand--very fine to fine grained with < 8% medium to very coarse grains, pebbles approximately 15% and ≤ 45 mm, sand--subangular, pebbles--subangular to subrounded, poorly sorted; sand--quartz, feldspar, limestone, pebbles--granite, quartzite, limestone; pale-yellowish-brown (10YR6/2); loose, powdery, moderate reaction with HCl; dry; gradational basal contact -----	47-49.5
Silty sand ; sand--very fine to fine grained, well sorted; grayish orange (10YR7/4) to moderate-yellowish-brown (10 YR5/4); loose to moderately cemented with CaCO ₃ , moderate to strong reaction with HCl; dry -----	49.5-53
Cobbly, pebbly sandy silt ; sand--approximately 40% and very fine to very coarse grained, pebbles and cobbles ≤15-20% and ≤ 80 mm, silt approximately 40%, subangular with minor subrounded pebbles and cobbles, poorly sorted; sand--quartz, limestone, feldspar, pebbles and cobbles--limestone, quartzite, granite, and greenstone; moderate-yellowish-brown (10 YR5/4) to pale-yellowish-brown (10YR6/2), 60-62 ft is moderate-orange-pink (5YR8/4); loose/powdery, moderate to strong reaction with HCl; dry, slightly moist from 60-62 ft -----	53-62
Sandy silt with pebbles and cobbles ; sand--very fine grained, pebbles 10% and ≤ 30 mm, subangular; pebbles--quartzite; moderate-orange-pink (5YR8/4); powdery, strong reaction with HCl; slightly moist-----	62-63

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Pebbly, cobbly sandy silt; sand--very fine grained, pebbles 20%, cobbles 20%, pebbles and cobbles < 90 mm, subangular; pebbles and cobbles--quartzite, minor limestone; moderate-orange-pink (5YR8/4); loose, strong reaction with HCl; slightly moist; abrupt basal contact -----	63-65.3
Silty sand with pebbles; sand--very fine to medium grained from 65.3-approximately 69 ft, 69-74.3 ft is very fine to fine grained with zones of medium grains, pebbles ≤ 12% and ≤ 63 mm, predominately < 25 mm, cobble zones from 67.8-70 ft with cobbles 12% and < 80 mm and 70-74.3 ft with cobbles 2% and ≤ 70 mm, subangular to subrounded; pebbles and cobbles--quartzite, limestone; light brown (5YR6/4), 67.8-70 ft--grayish-orange-pink (5YR7/2); loose to powdery, strong reaction with HCl; slightly moist to approximately 69 ft, moderately moist from approximately 69-74.3 ft -----	65.3-74.3
Sand with silt; sand--very fine to mostly medium grained, pebbles < 1% and ≤ 60 mm, subangular; pebbles--quartzite; moderate-orange-pink (5YR8/4); moderately compacted, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; moderately moist -----	74.3-76
Silty sand; sand--very fine to mostly medium grained, pebbles ≤ 1% and ≤ 15 mm, pebbles scattered throughout, subangular; pebbles--quartzite, minor limestone; light brown (5YR6/4); very poorly laminated; moderately compacted, slightly to moderately cemented with CaCO ₃ , strong reaction with HCl; slightly moist; abrupt basal contact -----	76-86.6
Pebbly silty sand; sand--very fine to medium grained in upper section and very fine to fine grained towards bottom, pebbles 15-20%, cobbles ≤ 8%, subangular to subrounded, cobbles are in sandy silt zones; pebbles and cobbles--limestone, quartzite; grayish-orange-pink (5YR7/2); loose to powdery, strong reaction with HCl; slightly moist; abrupt basal contact -----	86.6-93.6
Silty sand with pebbles; sand--very fine to mostly medium grained, pebbles 1% and ≤ 20 mm, subangular to subrounded; pebbles--limestone; light brown (5YR6/4); very poorly laminated; weakly cemented with CaCO ₃ , strong reaction with HCl; slightly moist; abrupt basal contact -----	93.6-94.6
Sandy silt with clay and pebbles; sand -very fine to fine grained, clay occurs in matrix, pebbles 12% and < 50 mm, subangular; pebbles--quartzite, minor limestone; grayish-orange-pink (5YR7/2); poorly laminated; loose to moderately cemented where clayey, strong reaction with HCl; slightly moist -----	94.6-96
Pebbly silty sand with cobbles; sand--very fine to medium grained with < 10% coarse to very coarse grains, pebbles 20-25%, pebbles and cobbles ≤ 100 mm (broken by drilling), subangular, minor subrounded; pebbles and cobbles--quartzite, minor limestone and greenstone; light brown (5YR6/4); includes zones of sandy silt with cobbles; loose where silty, weakly cemented with CaCO ₃ where sandy, strong reaction with HCl; slightly moist -----	96-104.6
Silty sand; sand--very fine to mostly medium grained, one pebble 30 mm, pebble--subangular and near 106 ft; pebble--quartzite; light brown (5YR5/6); very poorly laminated; weakly cemented with CaCO ₃ , strong reaction with HCl; slightly moist; abrupt basal contact -----	104.6-110.3

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Pebbly sandy silt and caliche; sand--very fine to fine grained, pebbles 15% and 5-30 mm, cobbles < 80 mm and near top of section, pebbles--subangular, cobbles--subangular to subrounded (some broken or cut by drilling); pebbles and cobbles--quartzite, limestone; light brown (5YR6/4); loose to weakly cemented with CaCO ₃ , strong reaction with HCl; slightly moist -----	110.3-115.3
Silty sand; sand--very fine to mostly medium grained; light brown (5YR5/6); very poorly laminated; weakly cemented with CaCO ₃ , strong reaction with HCl; slightly moist -----	115.3-117.8
Pebbly sandy silt with caliche and cobbles; sand--very fine to fine grained with medium grains in sandy central section, pebbles variable downwards from 30 to 5%, two cobbles ≤ 80 mm near upper contact, subangular with some subrounded; pebbles and cobbles--quartzite, minor limestone and greenstone; light brown (5YR6/4); loose to slightly to moderately cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl; slightly moist -----	117.8-122
Silty sand with caliche; sand--very fine to fine grained with zones of very fine to medium grains, pebbles < 0.5% and < 30 mm, pebbles widely scattered, subangular; pebbles--greenstone, schist; light brown (5YR6/4); poorly laminated; moderately compacted, weakly cemented with CaCO ₃ , caliche as matrix and rarely as stringer, strong reaction with HCl; slight moist -----	122-137
Sandy silt with caliche; sand--very fine to fine grained; light brown (5YR6/4); powdery, much of recovered material is 5-10 mm nodules of slightly cemented material, caliche as matrix, strong reaction with HCl; dry to slightly moist -----	137-139.1
Pebbly sandy silt; sand--very fine to fine grained, pebbles 15% and ≤ 60 mm, predominately 25-30 mm, subangular to subrounded; pebbles--limestone, minor quartz and granitics; light brown (5YR6/4); loose, strong reaction with HCl; dry to slightly moist -----	139.1-140.1
No recovery -----	141.1-143
Sandy silt with pebbles; sand--very fine to fine grained, pebbles < 3% and ≤ 60 mm, predominately 25-30 mm, subangular to subrounded; pebbles--limestone, minor quartz and granitics; light brown (5YR6/4); loose, strong reaction with HCl; dry to slightly moist; abrupt basal contact -----	143-145
Silty sand with pebbles and caliche; sand--very fine to medium grained, pebbles increase downwards to 10% and ≤ 60 mm, subrounded to mostly subangular; pebbles--quartzite, limestone; light brown (5YR6/4); very poorly laminated; slightly cemented with central section moderately cemented, CaCO ₃ cement, caliche as matrix, strong reaction with HCl; dry to slightly moist; abrupt basal contact -----	145-150.5
Sandy silt; silty sand zones gradationally interbedded, silt zones--sand is very fine to fine grained, sand zones--sand is very fine to medium grained, pebbles < 2% and ≤ 60 mm, predominately 25-30 mm, pebbles scattered, subangular to subrounded; pebbles--limestone, minor quartz and granitics; light brown (5YR6/4); poorly laminated; silt is loose, sand is weakly to strongly cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl; dry to slightly moist; abrupt basal contact -----	150.5-156

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Pebbly silty sand with caliche ; sand--very fine to medium grained, pebbles 20% and 5-50 mm, pebbles in upper 2 ft, subrounded to mostly subangular; pebbles--quartzite, limestone; light brown (5YR6/4); poorly laminated; weakly to strongly cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl; slightly moist -----	156-159
No recovery -----	159-160
Silty sand with clay, pebbles and cobbles ; sand--very fine to fine grained, very fine to medium grained from 165-166.5 ft, pebbles 5-10% and ≤ 40 mm, three cobbles ≤ 100 mm, pebbles--subangular, cobbles--subangular; sand--arkosic with abundant quartz, biotite, pebbles and cobbles--limestone, greenstone, quartzite; light brown (5YR5/6) to light brown (5YR6/4); loose/powdery to moderately compacted, moderately cemented with CaCO ₃ from 165-166.5 ft, strong reaction with HCl; moderately moist; gradational basal contact -----	160-166.5
Silty sand ; sand--very fine to fine grained; sand--arkosic; light brown (5YR5/6); zones of sand with silt; moderately compacted, strong reaction with HCl; moderately moist -----	166.5-169.5
Pebbly silty sand with caliche ; sand--very fine to fine grained with 20% medium to very coarse grains, pebbles 20% and ≤ 40 mm, predominately ≤ 20 mm, subangular; sand--arkosic, pebbles--quartzite, limestone; pinkish gray (5YR8/1); powdery, caliche very abundant as matrix, very strong reaction with HCl -----	169.5-171
Cobbles and pebbles in silt matrix ; cobbles and pebbles approximately 70%, cobbles > 63 mm to > 90 mm, pebbles ≤ 63 mm, predominately 20-50 mm, subangular to subrounded; cobbles--quartzite, metaquartzite, banded quartzite, pebbles--quartzite, quartz sandstone; fine matrix--pale-yellowish-brown (10YR6/2); loose, silty matrix--moderate reaction with HCl; dry; gradation basal contact, abrupt color change -----	171-174.5
Silty sand with clay ; sand--very fine to fine grained, well sorted; sand--arkosic with abundant quartz; moderate-yellowish-brown (10 YR5/4) to moderate brown (5YR4/4); clay content increases towards bottom; moderately to strongly compacted, moderate reaction with HCl; slightly moist to moist -----	174.5-179
Clayey silty sand ; sand--very fine to fine grained with < 2% medium to very coarse grains, subangular, moderately well sorted; sand--arkosic with abundant quartz; moderate brown (5YR4/4); moderately to strongly compacted, slight reaction with HCl; moist; abrupt basal contact -----	179-181
Pebbly sandy silt with cobbles ; sand--very fine to fine grained with approximately 8% medium to very coarse grains, pebbles approximately 5-25% and 4 to 63 mm, cobbles < 1% and > 90 mm, angular to subangular, minor subrounded, very poorly sorted; sand--arkosic with abundant quartz, pebbles and cobbles--quartzite, banded quartzite, limestone; pale-yellowish-brown (10YR6/2); loose, moderate reaction with HCl; dry -----	181-187
Clayey sandy silt with pebbles ; sand--very fine to fine grained, pebbles 5% and 15 to 50 mm, subangular to subrounded; sand--arkosic, pebbles--limestone, minor metagranite; moderate brown (5YR4/4); moderately compacted, moderate to strong reaction with HCl; very moist; abrupt basal contact -----	187-188.5

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Silty sand with caliche; sand--very fine to coarse grained, subangular to subrounded, becomes less coarse grained in lower 1 ft, subangular to subrounded; fine sand--arkosic, coarse sand--quartz, minor feldspar; grayish-orange-pink (5YR7/2) to light brown (5YR5/6) towards bottom; grades to sand with silt in lower approximately 0.5 ft; loose/powdery to moderately compacted towards bottom, caliche very abundant as matrix, strong reaction with HCl; slightly moist; abrupt basal contact -----	188.5-191
Clayey silty sand with pebbles; sand--very fine to fine grained with 5% medium to very coarse grains, pebbles 7% and 2-6 mm, pebbles--subangular to subrounded; sand--arkosic, pebbles--quartz, feldspar; light brown (5YR5/6); moderately to strongly compacted, strong reaction with HCl; very moist; fairly abrupt basal contact -----	191-192
Silty sand; sand--very fine to fine grained with 8% medium to very coarse grains, subangular to subrounded; sand--arkosic; light brown (5YR5/6); moderately compacted, minor caliche blebs to 15 mm, strong reaction with HCl; moderately moist -----	192-193.2
No recovery -----	193.2-195
Pebbly sand with silt; sand--very fine to very coarse grained, pebbles 40-70% and \leq 60 mm, predominately \leq 10 mm, sand--subangular to subrounded, pebbles--subangular, poorly sorted; sand--arkosic, pebbles--limestone, quartzite, greenstone, granite; light brown (5YR5/6); loose, strong reaction with HCl; moist to very moist; abrupt basal contact -----	195-197
Sandy silt with clay; sand--very fine to fine grained, clay minor; sand--arkosic; light brown (5YR5/6); moderately to strongly compacted, strong reaction with HCl; very moist -----	197-205
Silty pebbly sand; sand--very fine to medium grained with 10% coarse to very coarse grains, pebbles 25% and \leq 40 mm, predominately (60%) 2-5 mm, pebbly sand with silt zone from 205.9-206.8 ft where sand is very fine to very coarse grained, pebbles 40% and $<$ 20 mm, predominately 2-6 mm, sand--subangular, pebbles--subangular to subrounded; sand--arkosic with abundant quartz, pebbles--quartzite, granite, greenstone; light brown (5YR6/4); loose, strong reaction with HCl; slightly moist, 205.9-206.8 ft--moist; abrupt basal contact -----	205-209
Silty sand; sand--very fine to medium grained, subangular to subrounded; sand--arkosic; light brown (5YR5/6); moderately compacted, strong reaction with HCl; very moist; abrupt basal contact -----	209-210.8
Silty pebbly sand; sand--very fine to medium grained with 10% coarse to very coarse grains, pebbles 25% and \leq 40 mm, predominately (60%) 2-5 mm, sand--subangular, pebbles--subangular to subrounded; sand--arkosic, pebbles--quartzite, granite, greenstone; light brown (5YR6/4); loose, strong reaction with HCl; slightly moist; fairly abrupt basal contact -----	210.8-214
Silty sand; sand--approximately 60% and very fine grained with 15% fine to medium grains. lower 1.1 ft is very fine to fine grained, finer grains--subangular, medium sand grains--subrounded, very well sorted in lower 1.1 ft; sand--arkosic with abundant quartz; light brown (5YR6/4) to moderate-yellowish-brown (10 YR5/4) towards bottom; moderately compacted, lower 1.1 ft is loose to slightly compacted, strong reaction with HCl, lower 1.1 ft has weak to moderate reaction; moderately moist; abrupt basal contact-----	214-218.1

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Pebbly silty sand; sand--very fine to very coarse grained, pebbles approximately 15% and \leq 55 mm, one cobble 75 mm, sand--subangular, pebbles and cobble--subangular, very poorly sorted; sand--quartz, minor feldspar, pebbles--granite, quartzite, limestone, cobble--granite; pale-yellowish-brown (10YR6/2); loose, strong reaction with HCl; very slightly moist; fairly abrupt basal contact -----	218.1-223.4
Silty sand with caliche; sand--predominately very fine to fine grained with approximately 2-10% medium to very coarse grains, minor clay from 227.5-229 ft, pebbles $<$ 2% and \leq 10 mm, coarser sand--subangular, moderately well to well sorted; sand--quartz, minor feldspar, pebbles--quartzite, limestone; light brown (5YR5/6), moderate-yellowish-brown (10 YR5/4) where caliche is more abundant, moderate brown (5YR4/4) where clay is present; moderately to strongly compacted/cemented, caliche as blebs, stringers, and as matrix mostly from 223.4-227.5 ft, moderate to strong reaction with HCl; 223.4-227.5 ft--slightly to moderately moist, 227.5-229 ft--moderately moist to moist -----	223.4-229
Clayey silty sand; sand--very fine to fine grained with $<$ 2% medium to very coarse grains, coarser sand--subangular, well sorted; sand--quartz, minor feldspar; moderate-yellowish-brown (10 YR5/4), moderate brown (5YR4/4) where clay is more abundant; strongly compacted, moderate to strong reaction with HCl; moderately moist to moist -----	229-233.7
Cobbly pebbly silty sand; sand--very fine to very coarse grained, pebbles approximately 20% and \leq 63 mm, cobbles approximately 15% and 63 mm to $>$ 80 mm (fractured by drilling), sand, pebbles and cobbles--subangular to angular, very poorly sorted; sand--predominately quartz and limestone, less feldspar, pebbles--limestone, quartzite, granite, cobbles--limestone; pale-yellowish-brown (10YR6/2) to light brown (5YR6/4); loose, moderate reaction with HCl; dry to very slightly moist; gradational basal contact -----	233.7-239.8
Silty sand; sand--very fine to fine grained, pebbles $<$ 0.5% and 2 to 4 mm, pebbles--subangular to angular, well sorted; sand--predominately quartz, minor feldspar, pebbles--quartzite, limestone; moderate-yellowish-brown (10 YR5/4) to light brown (5YR5/6); moderately to strongly cemented with CaCO_3 , friable, strong reaction with HCl; slightly moist -----	239.8-241.4
No recovery -----	241.4-243
Sand with silt; sand--very fine to fine grained with 10-20% medium to very coarse grains, pebbles $<$ 0.5% and 15-40 mm from approximately 243-245.5 ft and 7% and \leq 5 mm from approximately 245.5-246 ft with one 60 mm clast, sand--angular to subangular, some subrounded, pebbles--subangular; sand--arkosic, medium to coarse sand--quartz, minor feldspar, pebbles--quartzite, limestone, weathered granite, clast is weathered greenstone; 243--approximately 245.5 ft--light brown (5YR5/6), approximately 245.5-250 ft--moderate-orange-pink (5YR8/4); loose to moderately compacted, weakly cemented with CaCO_3 , strong reaction with HCl; very moist to moderately moist towards bottom; abrupt basal contact at approximately 245.5 ft (pebbly zone) -----	243-250

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Silty sand; sand--very fine to fine grained with 5-20% medium to coarse grains, sandstone lens fragment 25 mm thick at approximately 253.6 ft, subangular; sand--arkosic, larger sand grains--quartz; 250-252 ft--light brown (5YR5/6), 252-256 ft--light brown (5YR6/4), sandstone lens light brown (5YR6/4); moderately compacted, 252-256 ft also weakly to moderately cemented with CaCO ₃ , sandstone lens very hard and cemented with CaCO ₃ , strong reaction with HCl; 250-252 ft--very moist, 252-256 ft--moderately moist; fairly gradational basal contact -----	250-256
Sandy silt; sand--≤ 30-40%, decreasing downward, and very fine to coarse grained, very fine with minor fine to medium grains from 264-273 ft, zones of silty sand, boulder at approximately 264-265 ft with few pebbles 20-35 mm, sand and pebbles--mostly subangular to subrounded; sand--arkosic, coarser sand grains--quartz, pebbles--limestone, boulder--quartzite; 256-264 ft--light brown (5YR6/4), 264-265 ft (boulder zone)--grayish-red-purple (5RP4/2), 265-273 ft--dark-yellowish-orange (10YR6/6); loose/powdery where disturbed, moderately to firmly compacted and moderately to strongly cemented with CaCO ₃ where undisturbed, strong reaction with HCl; 256-258 ft--moderately moist, 258-273 ft--very moist -----	256-273
Silty sand; very fine grained with minor fine to medium grains; sand--arkosic; light brown (5YR6/4); moderately compacted, strong reaction with HCl; very moist -----	273-274.5
Pebbles in sandy silt matrix; sand--45% of matrix and very fine to very coarse grained, pebbles 80% and ≤ 63 mm, 1 cobble 100 mm (fractured by drilling), sand--angular to subangular, pebbles--subangular; sand--arkosic, coarser grains similar to pebbles, pebbles--quartzite, limestone, metagranite, includes fragments of sandstone lens, cobble--quartzite; light brown (5YR6/4); loose to powdery, caliche very abundant as matrix in lower 0.5 ft, strong reaction with HCl; moderately moist; abrupt basal contact due to cobble -----	274.5-277.3
Pebbly sand with silt; sand--very fine to very coarse grained, pebbles 35% and ≤ 30 mm, predominately < 6 mm, sand--angular to subangular, pebbles--angular to subangular with few subrounded; sand--arkosic, coarser grains similar to pebbles, pebbles--quartzite, limestone, greenstone; light brown (5YR6/4); central 0.3 ft zone is less pebbly; loose to moderately compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist; abrupt basal contact -----	277.3-279.4
Silty sand; sand--very fine to medium grained; sand--arkosic; light brown (5YR5/6); loose to moderately compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist -----	279.4-280
Silt; sand--approximately 3% and very fine grained; sand--arkosic; light brown (5YR5/6); moderately to strongly compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist; abrupt basal contact -----	280-284.3

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Silty sand with pebble zones; sand--very fine to fine grained or very fine to medium grained, very fine to very coarse grained in upper 0.7 ft, pebbles (zonal), < 50% and ≤ 60 mm within zones sand--angular to subangular, pebbles--subangular (fractured due to drilling); sand--arkosic, coarser sand grains similar to pebbles, pebbles--quartzite, minor limestone, granite, greenstone, and schist; 25 mm thick conglomeratic lens fragments of CaCO ₃ cemented pebbles in 284.3-285 ft zone; matrix--light brown (5YR6/4), 292-294 ft--light brown (5YR5/6); pebble zones from 284.3-292 ft, 285.6-286 ft, 286.8-287.2 ft, and 288.9-289.3 ft; loose to moderately compacted, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; very moist; abrupt basal contact -----	284.3-294
Pebbly silty sand with caliche; sand--very fine to very coarse grained, very fine to medium grained where siltier (294-295 ft and 298-299 ft), pebbles 20% and ≤ 63 mm, one cobble--150 mm, sand--angular to subangular, pebbles--subangular with few subrounded, cobble--subangular, poorly sorted; sand--arkosic with abundant quartz, limestone, pebbles--mostly limestone, less quartzite, minor greenstone and weathered granite, cobble--limestone; light brown (5YR6/4); loose/powdery to moderately/firmly compacted and moderately cemented with CaCO ₃ , caliche abundant as matrix, strong reaction with HCl; 294-302.3 ft--moderately moist, 302.3-304 ft--very moist -----	294-304
Silty sand; sand--very fine to fine grained with minor medium to very coarse grains, coarser sand grains--angular to subangular, well sorted; sand--arkosic with abundant quartz; 304--approximately 313 ft--light brown (5YR5/6), approximately 313-316.5 ft--moderate-yellowish-brown (10 YR5/4); moderately to firmly compacted, moderately cemented with CaCO ₃ , moderate to strong reaction with HCl; moderately to very moist; gradational basal contact -----	304-316.5
Sand with silt; sand--very fine to medium grained with < 5% coarse to very coarse grains, angular to subangular, moderately well sorted; sand--arkosic, quartz abundant; moderate-yellowish-brown (10 YR5/4); loose, strong reaction with HCl; moist; gradational basal contact -----	316.5-317.6
Pebbly sandy silt; sand--predominately very fine to fine grained with approximately 10% medium to very coarse grains, pebbles approximately 15% and ≤ 37 mm, sand and pebbles--angular to subangular, poorly sorted; sand--arkosic with abundant quartz, pebbles--limestone, quartzite, granite; very-pale-orange (10YR8/2); loose with some zones of moderately cemented clasts, CaCO ₃ cementing, friable, strong reaction with HCl; dry -----	317.6-319
Sandy silt; sand--very fine grained, well sorted; sand--arkosic with abundant quartz; pale-yellowish-brown (10YR6/2); loose/powdery, strong reaction with HCl; dry; gradational basal contact -----	319-320.2
Sand with silt; sand--very fine to fine grained with < 2% medium to very coarse grains, 320.2 ft to approximately 320.8 ft contains minor clay, coarser grains--subangular to angular, well to very well sorted; sand--arkosic with abundant quartz; 320.2-320.8 ft--moderate-yellowish-brown (10 YR5/4) to moderate brown (5YR4/4), 320.8-325 ft grayish orange (10YR7/4) to dark-yellowish-orange (10YR6/6); moderately compacted, moderately compacted/cemented with CaCO ₃ cement from 324-326 ft, friable, moderate reaction with HCl at top to strong reaction towards bottom; dry to moist; gradational basal contact -----	320.2-325

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Silty sand; sand--predominately very fine to fine grained with approximately 11% medium to very coarse grains, pebbles < 0.5% grading downward to approximately 10% at 328-329 ft and ≤ 20 mm, coarser sand--subangular to angular, pebbles--angular to subrounded, few subrounded, moderately well sorted; to poorly sorted towards bottom sand--arkosic with abundant quartz, pebbles--limestone, quartzite, schist, greenstone, granite; grayish orange (10YR7/4) to moderate-yellowish-brown (10 YR5/4); loose to moderately to strongly cemented, CaCO ₃ cement, strong reaction with HCl; dry to slightly moist towards bottom; gradational basal contact -----	325-329
Pebbly sandy silt; sand--predominately very fine to fine grained with approximately 10-20% (increasing downward) medium to very coarse grains, pebbles 15-20% and ≤ 55 mm, sand and pebbles--angular to subangular, poorly sorted; sand--arkosic with abundant quartz, pebbles--quartzite, granite, limestone, greenstone; very-pale-orange (10YR8/2) to pale-yellowish-brown (10YR6/2); loose to strongly cemented, CaCO ₃ cement, visible CaCO ₃ cement between coarse grained sand, very strong reaction with HCl; very slightly moist to dry -----	329-331
Silty sand; very fine to fine grained with zones of very fine to very coarse grains (medium to very coarse grains usually being < 15%), sand--angular to subangular, minor subrounded, poorly sorted in presence of medium to very coarse sands; sand--arkosic, larger sand grains mostly quartz; 331-332 ft--light brown (5YR6/4), 332--approximately 334 ft--dark-yellowish-orange (10YR6/6), approximately 334-348 ft--light brown (5YR5/6) to light brown (5YR6/4); loose to powdery at top approximately 3 ft, otherwise moderately compacted, moderately to strongly cemented with CaCO ₃ , strong reaction with HCl; 331-332 ft--slightly moist, 332-348 ft--moderately to very moist -----	331-348
Sandy silt; sand--very fine grained or fine to very fine grained, pebbly sandy silt zone from approximately 353.5-354 ft with pebbles 20% (within zone) and ≤ 15 mm, 2 clasts 25 mm (fractured by drilling), pebbles--subangular; sand--arkosic, pebbles--quartzite, limestone, granite, metagranite; light brown (5YR6/4); loose to moderately to firmly compacted, moderately cemented with CaCO ₃ , 0.3 ft zone near 354 ft has abundant caliche as matrix, strong reaction with HCl; moderately to very moist -----	348-356
Silt with sand; sand 5% to 10% and very fine to fine grained; sand--arkosic; light brown (5YR5/6); moderately compacted, moderately to strongly cemented with CaCO ₃ , strong reaction with HCl; very moist; abrupt basal contact -----	356-360.4
Sandy silt grading to Silty sand; sand--very fine grained grading to very fine to medium grained with 5-10% coarse to very coarse grains, larger sand grains--angular to subangular; sand--arkosic, larger sand grains--quartz; light brown (5YR6/4); moderately compacted, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; moderately to very moist; abrupt basal contact -----	360.4-361.9
Pebbly silty sand; sand--very fine to fine grained with 20% medium to very coarse grains, pebbles 20% and < 50 mm, sand--angular to subangular, pebbles--subangular, poorly sorted; sand--arkosic, larger sand grains--quartz, pebbles--limestone, metagranite; light brown (5YR6/4); loose to moderately compacted, moderately cemented with CaCO ₃ ; moderately moist; abrupt basal contact -----	361.9-363

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Sand with silt; sand--very fine to very fine grained with 5% medium grains, silt minor; sand--arkosic with abundant quartz; dark-yellowish-orange (10YR6/6); loose; very moist; abrupt basal contact -----	363-363.5
Pebbly sand with silt; sand--very fine to fine grained with 30% medium to very coarse grains, pebbles 35% and < 50 mm, predominately < 6 mm, silt minor, larger sand grains--angular to subangular, pebbles--subangular, very poorly sorted; sand--arkosic with abundant quartz, pebbles--limestone, quartzite; dark-yellowish-orange (10YR6/6); loose to moderately compacted, moderately cemented with CaCO ₃ , caliche powder abundant around larger pebbles 0.6 ft from top of section, strong reaction with HCl; very moist -----	363.5-366
Silty sand and Sandy silt; sand--very fine to fine grained with minor medium grains; sand--arkosic; light brown (5YR5/6); siltstone lens fragments 50-60 mm thick occur in upper section and one in lower central section; moderately to firmly compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist; gradational basal contact -----	366-371.6
Sand with silt and pebbles; sand--very fine to fine grained with 10% medium to very coarse grains, pebbles < 40 mm, cobble at base of section (broken in drill bit to approximately 100 mm), pebbles and cobble--subangular; sand--arkosic, pebbles--limestone, quartzite, granite, greenstone, cobble--quartzite; dark-yellowish-orange (10YR6/6); moderately to firmly compacted, weakly cemented with CaCO ₃ , strong reaction with HCl; very moist -----	371.6-375
Sandy silt; sand--very fine to fine grained or very fine to medium grained, upper section has scattered pebbles 1% and < 5 mm, pebbles--angular to subangular; sand--arkosic with abundant quartz, pebbles--limestone, quartzite; 375--approximately 384 ft--light brown (5YR5/6), approximately 384-385 ft--light brown (5YR6/4), 385-390 ft--dark-yellowish-orange (10YR6/6); loose to moderately compacted, powdery in some zones, moderately cemented with CaCO ₃ , caliche abundant as matrix from 383-385 ft, strong reaction with HCl; very moist, slightly moist where caliche is abundant (383-385 ft) -----	375-390
Pebbly sand; sand--very fine to very coarse grained, pebbles 35% and < 35 mm, predominately (80%) < 12 mm, sand--angular to subangular, poorly sorted; sand--arkosic with abundant quartz, pebbles--limestone, quartzite, minor greenstone and granite; light brown (5YR6/4); few lenses (30-60 mm thick) of fine to medium grained sand and 5 mm poorly defined lenses of smaller size pebbles; loose to moderately compacted, weakly cemented with CaCO ₃ , strong reaction with HCl; very moist; abrupt basal contact ----	390-392
Sand with silt; sand--very fine to fine grained with 10% medium grains; sand--arkosic with abundant quartz; dark-yellowish-orange (10YR6/6); moderately compacted, strong reaction with HCl; very moist -	392-394
Silty sand; sand--very fine to fine grained grading to very fine to medium grained with 5-10% coarse to very coarse grains, pebbles and cobbles < 1% and < 70 mm, pebbles--subangular (freshly broken by drilling); sand--arkosic with abundant quartz, pebbles and cobbles--quartzite, limestone, minor greenstone; dark-yellowish-orange (10YR6/6) to light brown (5YR6/4); larger clasts occur as 0.2 ft lenses, poorly cemented and coated with caliche, 0.2 ft clay zone at approximately 407.5-407.7 ft with abrupt upper and basal contacts; moderately to strongly compacted, weakly to moderately cemented with CaCO ₃ strong reaction with HCl; very moist; basal contact is a pebble/cobble lens -----	394-411.9

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Silt with sand; sand--very fine grained, 0.2 ft siltstone lens at top; sand--arkosic; light brown (5YR5/6); powdery in central 0.2 ft zone, moderately compacted and moderately cemented with CaCO ₃ , caliche as matrix more abundant in upper section, strong reaction with HCl; very moist -----	411.9-414
Silty sand; sand--very fine to medium grained, pebbles < 50 mm in a 0.2 ft zone 1 ft from top of interval, sand--angular to subrounded, pebbles--subangular; sand--arkosic with abundant quartz, pebbles--quartzite, limestone; 414-417 ft--dark-yellowish-orange (10YR6/6), 417-425 ft--light brown (5YR5/6); moderately compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist -----	414-425
Sand; very fine to medium grained with 10% coarse to very coarse grains grading to very fine to fine grained, subangular to few subrounded; sand--arkosic with abundant quartz; light brown (5YR5/6); moderately compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist -----	425-429
Silt with minor clay; silt--arkosic; light brown (5YR5/6); moderately to strongly compacted/cemented with CaCO ₃ , strong reaction with HCl; very moist; gradational basal contact -----	429-431.5
Silty sand; sand--very fine to fine grained with 7% medium grains; sand--arkosic; dark-yellowish-orange (10YR6/6); sandstone lens fragments (disturbed) in lower central section; loose to moderately compacted, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; very moist -----	431.5-436
Pebbly silty sand with cobble; sand--very fine to very coarse grained, pebbles 20% and < 60 mm, cobble approximately 100 mm (broken by drilling), sand--angular to subangular, pebbles and cobble--subangular, poorly sorted (disturbed); sand--arkosic with abundant quartz, limestone, pebbles--limestone, quartzite, cobble--quartzite; light brown (5YR5/6); loose to moderately compacted, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; moderately moist; abrupt basal contact -----	436-441.5
Sandy silt; sand--very fine to fine grained with 5% medium grains; sand--arkosic; dark-yellowish-orange (10YR6/6); moderately compacted, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; very moist -----	441.5-444
Silty sand; sand--very fine to medium grained, clay minor from 444-447 ft, gradational zones of sandy silt from 447-454 ft, angular to subangular; sand--arkosic; light brown (5YR5/6); moderately compacted, moderately cemented with CaCO ₃ from 447-454 ft, strong reaction with HCl; very moist (possibly saturated from 444-454 ft) -----	444-454
Sandy silt with clay; sand--very fine to fine grained or very fine to medium grained; sand--arkosic; light brown (5YR5/6); moderately compacted, moderately to strongly cemented with CaCO ₃ , abundant caliche as matrix in lower 3.2 ft, strong reaction with HCl; very moist in upper section, moderately moist in lower section; gradational basal contact -----	454-459
Silty sand with caliche; sand--very fine to fine grained with < 10% medium grains; sand--arkosic with abundant quartz; light brown (5YR6/4); powdery, remnant pieces are moderately compacted and strongly cemented with CaCO ₃ , caliche very abundant as matrix, strong reaction with HCl; slightly to moderately moist; abrupt basal contact -----	459-460

Table 9.--Lithology penetrated by borehole LWDS-MW1--Continued

Lithologic description	Depth interval below land surface (feet)
Sandy silt; sand--very fine to fine grained; sand--arkosic; light brown (5YR5/6); moderately to firmly compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; moderately to very moist; gradational basal contact -----	460-464
Silty sand; sand--very fine to medium grained, pebbles 5% and < 10 mm in lower 0.5 ft, pebbles--subangular to subrounded; sand--arkosic with abundant quartz, pebbles--limestone, quartzite, matrix of lower 0.5 ft has abundant magnetite particles; dark-yellowish-orange (10YR6/6), lower 0.5 ft is light brown (5YR5/6) with pale olive (10Y6/2) and light-olive-gray (5Y5/2) rind on core; moderately to strongly compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist -----	464-469.5
Pebbly silty sand; sand--very fine to medium grained, pebbles 40% and < 60 mm, 1 cobble > 80 mm (broken by drilling), pebbles--subangular; sand--arkosic with abundant quartz, pebbles--limestone, quartzite, cobble--limestone; light brown (5YR5/6), matrix over base of pebbly zone--pale olive (10Y6/2) and light-olive-gray (5Y5/2); matrix has abundant magnetite particles; moderately to strongly compacted, caliche/CaCO ₃ as matrix and surface coating/cement on clasts, strong reaction with HCl; very moist; abrupt basal contact -----	469.5-470.8
Silty sand; 470.8-approximately 497 ft--sand is very fine to fine grained with ≤5% medium grains in zones, grades to very fine grained with abundant silt from approximately 473-476 ft, 497-505.5 ft--sand is very fine to medium grained with very coarse grains from 497-498 ft, 476-477 ft contains 30 mm sandstone lens, 477-494 ft contains two 70 mm semi-consolidated sandstone lenses about 2 feet apart, approximately 499.5-505.5 ft has pebbles < 0.5% and ≤ 12 mm, predominately < 5 mm, minor clay in scattered zones, larger sand grains--subangular, pebbles--subangular, well sorted to poorly sorted where coarser grains are present; sand--arkosic, larger sand grains--quartzite, pebbles--limestone, quartz; 470.8-approximately 499.5 ft--light brown (5YR5/6), approximately 499.5-505.5 ft--dark-yellowish-orange (10YR6/6); one 40 mm siltstone lens in center of section; moderately to firmly compacted, zones moderately to strongly cemented with CaCO ₃ , strong reaction with HCl; 470.8-477 ft is very moist; 2.8 ft zone from 477-494 ft is wet (saturated) and dry(?) below (depths uncertain), 494-495 ft is very moist, 495-505.5 ft is wet (saturated), moist where cemented; abrupt basal contact -----	470.8-505.5
Pebbly, cobbly, silty sand; sand--very fine to fine grained with 15% medium to coarse grains, pebbles and cobbles 40%, and < 100 mm, subangular; sand--arkosic, larger sand grains--quartz, pebbles and cobbles--quartzite, very weathered greenstone, minor limestone; dark-yellowish-orange (10YR6/6); zone shows much decomposition; firmly compacted, CaCO ₃ as coating on clasts and as weak cement, strong reaction with HCl; wet to moist; abrupt basal contact -----	505.5-506.8
Silty sand; sand--very fine to fine grained with ≤10% medium grains from 506.8-509.5 ft and very fine to medium grained with 0-20% coarse to very coarse grains from 521-522.1 ft, clay minor from 508.5-521 ft, pebbles <3% and < 20 mm, predominately ≤ 5 mm, from approximately 519-522.1 ft, sand--angular to subangular; sand--arkosic, with abundant quartz from 521-522.1 ft, pebbles--limestone, quartzite, and greenstone; 506.8-508.6 ft--dark-yellowish-orange (10YR6/6), 508.6-522.1 ft--light brown (5YR5/6); moderately to strongly compacted, 506.8-508.6 ft has central zone moderately cemented with CaCO ₃ , strong reaction with HCl; wet (saturated), moist where cemented; abrupt basal contact -----	506.8-522.1

Table 9.--Lithology penetrated by borehole LWDS-MW1--Concluded

Lithologic description	Depth interval below land surface (feet)
Pebbly silty sand with cobble; sand--very fine to medium grained with poorly defined disturbed zones of coarse to very coarse grains, pebbles 30-70% and ≤ 50 mm, predominately ≤ 8 mm, cobble > 90 mm (broken by drilling), sand and pebbles--angular to subangular; sand--arkosic with abundant quartz, quartzite, limestone, pebbles--quartzite, limestone, cobble--quartzite; conglomeratic lens, fragments (< 5 mm) of angular to subangular sand and pebbles strongly cemented with CaCO_3 ; light brown (5YR5/6); moderately compacted, strong reaction with HCl; saturated; abrupt basal contact -----	522.1-523.4
Silty sand; sand--very fine to medium grained with 0-20% coarse to very coarse grains, pebbles $< 2\%$ and < 6 mm, angular to subangular; sand--arkosic with abundant quartz, pebbles--limestone, quartzite; light brown (5YR5/6); moderately compacted, strong reaction with HCl; saturated -----	523.4-523.8
No recovery -----	523.8-525

**SANDIA NATIONAL LABORATORIES
ALBUQUERQUE ENVIRONMENTAL RESTORATION PROGRAM**

LITHOLOGIC LOG

Area 5, Liquid Waste Disposal System - (LWDS-MW2)

Note: On 12-13AUG92 core was collected from 0' to 86' in a hole called LWDS-3. A new hole was started approximately 7' west of LWDS-3. The new hole was reamed to 89.6' where coring resumed on 06SEP92. The well location name was renamed LWDS-MW2. A third hole was started approximately 10' east of the original hole. The new hole was reamed to 116' where coring resumed on 17SEP92. Core was collected from 116' to 500'. Cuttings were collected by air-rotary drilling from 500' to 530'. Core was collected from 530' to 531' total depth.

Lithologies logged by U.S. Geological Survey geologists Cynthia Abeyta and Joe Szalona as follows:

<u>Depth</u>	<u>Date</u>	<u>Geologist</u>
0' to 86'	12AUG92 to 13AUG92	C. Abeyta
86' to 531'	06SEP92 to 21OCT92	J. Szalona

Percentage of hole logged by each geologist:

C. Abeyta	16%
J. Szalona	84%

Table 10.--Lithology penetrated by borehole LWDS-MW2

[Color designation from Rock-Color Chart (National Research Council, 1948). See figure 1 for protocol used in naming of unconsolidated sediments. %, percent; ≤ less than or equal to; ≥, greater than or equal to; <, less than; >, greater than; ft, feet; mm, millimeters; HCl, hydrochloric acid; CaCO₃, calcium carbonate]

Lithologic description	Depth interval above land surface (feet)
<i>NOTE: For lithology of 0-96 ft see lithologic log for LWDS-R113 which is located approximately 7 ft east of LWDS-MW2. LWDS-MW1 was reamed to 89.5 ft where coring resumed -----</i>	0-96
Silty sand; sand--very fine to medium grained, pebbles < 2% and ≤ 30 mm, pebbles--angular to subangular; pebbles--limestone, quartzite, minor decomposed granite; light brown (5YR5/6); moderately compacted/cemented with CaCO ₃ , caliche occurs as blebs and as matrix in upper section, strong reaction with HCl; slightly to moderately moist; abrupt basal contact -----	89.5-92.5
Pebbly sandy silt; sand--very fine to fine grained, mostly coarse grained where sandy, pebbles 25% and ≤ 63 mm, sand, pebbles--angular to subrounded; sand--arkosic with abundant quartz, pebbles--quartzite; very pale-orange (10YR8/2) where silty; becomes more sandy and less gravelly towards bottom; loose to weakly cemented, strong reaction with HCl; slightly moist -----	92.5-94
Sandy silt with pebbles; sand--very fine to fine grained with silty sand lenses ≥25 mm thick of mostly medium sand, pebbles < 8% and ≤ 25 mm, cobbles < 5% from approximately 94-95.5 ft, section contains zones of silty sand with pebbles, pebbles and cobbles--angular to subrounded; pebbles--limestone, cobbles--quartzite; light brown (5YR6/4), light brown (5YR5/6) where sandy; loose to moderately cemented where sandy, CaCO ₃ cement, strong reaction with HCl; slightly moist -----	94-97.6
Cobbly pebbly sandy silt; sand--very fine to fine grained, pebbles 25% and ≤ 40 mm, cobble--120 mm, pebbles and cobble--subangular; pebbles and cobble--limestone; slightly moist; abrupt basal contact -----	97.6-98.3
Silty sand; sand--very fine to mostly medium grained, pebbles < 5% and ≤ 30 mm from 98.3-102.5 ft, 1% and ≤ 8 mm from 102.5-107 ft, pebbles--angular to subrounded, pebbly at upper contact, pebbles ≤ 30 mm also occur in a 50 to 100 mm thick zone from approximately 106-107 ft, otherwise pebbles scattered; pebbles--limestone, quartzite, greenstone, minor sandstone; light brown (5YR5/6); very poorly laminated, caliche increases as matrix and minor stringers in lower section; moderately compacted/cemented, CaCO ₃ cement, caliche occurs as matrix and few stringers from 102.5-107 ft, strong reaction with HCl; 98.3-102.5 ft--slightly moist, 102.5-107 ft--moderately moist -----	98.3-107
Pebbles in clayey, sandy silt matrix; sand--very fine to medium grained, coarse to very coarse grained where pebbly, pebbles 50% and ≤ 63 mm, predominately 16 to 32 mm, pebbles--subangular to subrounded and clast supported; pebbles--limestone, quartzite; light brown (5YR5/6); moderately to strongly compacted/cemented, CaCO ₃ cement; moist; abrupt basal contact due to cementation -----	107-108.5
Pebbles and cobbles in sandy silty matrix; sand--very fine to fine grained with minor medium to very coarse grains, pebbles 35% and 16 to 63 mm, cobbles 20% and < 100 mm, angular to mostly subangular; pebbles and cobbles--quartzite; pale-yellowish-brown (10YR6/2); loose, strong reaction with HCl; slightly moist; abrupt basal contact -----	108.5-111.5

Table 10.--Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
Silty sand; sand--very fine to medium grained, well sorted; 111.5-113 ft--light brown (5YR5/6), 113-116 ft--light brown (5YR6/4); poorly laminated; moderately compacted/cemented, CaCO ₃ cement, caliche as matrix and minor blebs from approximately 114-116 ft, strong reaction with HCl; 111.5-113 ft--slightly moist, 113-116 ft--moderately moist -----	111.5-116
<i>NOTE: A new hole was started approximately 10 ft east of the original hole (LWDS-3). The new hole was reamed to 116 ft where coring resumed</i>	
Silty sand with pebbles; sand--medium to very coarse grained with minor very fine to fine grains, pebbles < 5% and < 8 mm where sandy, pebbly zones 20 to 40% and 16 to 63 mm, cobbles < 0.5% and 70 to 120 mm, sand--subangular to subrounded, pebbles and cobbles--subrounded to mostly subangular with fragment breaks (due to drilling); sand--arkosic, pebbles and cobbles--limestone, quartzite, minor greenstone; matrix--moderate-yellowish-brown (10YR5/4); zones of interbedded pebbles and cobbles in a silty sand matrix, cobbles occur in mid-lower pebbly zone, poorly laminated where sandy, powdery caliche is found as coating around limestone cobbles and pebbles; moderately compacted, sand--weakly cemented with CaCO ₃ , moderate to strong reaction with HCl; slightly moist -----	116-124.5
No recovery -----	124.5-127
Silty sand; sand--127-129.6 ft is very fine to medium grained, 129.6-131.9 ft is very fine to fine grained, well sorted; 127-129.6 ft--moderate-yellowish-brown (10YR5/4), 129.6-131.9 ft--light brown (5YR6/4); poorly laminated, 20 mm lens of well cemented very fine to very coarse grained sand at 129.6 ft; loose to moderately compacted, weakly/moderately cemented with CaCO ₃ , caliche occurs as matrix, strong reaction with HCl; slightly moist -----	127-131.9
No recovery -----	131.9-136
Silty sand with caliche; sand--very fine to medium grained, well sorted; light brown (5YR5/6); poorly laminated; moderately compacted, weakly to strongly cemented with CaCO ₃ , caliche as scattered stringers and as matrix increasing towards bottom, strong reaction with HCl; slightly moist; gradational basal contact -----	136-142
Pebbly silty sand; sand--very fine to very coarse grained, pebbles 35% and ≤ 60 mm, very poorly sorted; pebbles--limestone, quartzite, minor weathered porphyry; grayish-orange-pink (5YR7/2); moderately compacted, loose to powdery where caliche coats limestones, strong reaction with HCl; slightly moist-----	142-143
Silty sand; sand--very fine to mostly medium grained, pebbles in 1.3 ft zone near 143 ft are 25% and < 40 mm, subangular with minor subrounded, matrix is well sorted, pebbles are poorly sorted, minor clay; pebbles--quartzite, granite, minor limestone, light brown (5YR5/6); poorly laminated; moderately to firmly compacted, weakly to strongly cemented with CaCO ₃ , caliche as scattered stringers and as matrix, strong reaction with HCl; slightly moist -----	143-151.9
No recovery -----	151.9-154.5

Table 10.--Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
Silty sand ; sand--very fine to fine grained in the upper and lower sections and grades to mostly medium in the central section, well sorted, minor clay; moderate brown (5YR4/4) where coarser, to light brown (5YR6/4); poorly laminated; loose to weakly cemented or strongly compacted and moderately to strongly cemented in coarser central section, caliche occurs as scattered stringers and as matrix mostly in the upper and lower sections, strong reaction with HCl; very moist in central section, otherwise slightly moist -----	154.5-162
Clayey silt with sand ; sand--very fine to fine grained, well sorted; moderate brown (5YR4/4); contains zones of silty sand with clay; moderately to firmly compacted, minor caliche in the upper section as blebs or nodules < 25 mm, grades downward from strong reaction with HCl to no reaction; grades downward from moist/very moist to saturated; abrupt basal contact due to moisture content and absence of caliche --	162-166.9
Silty sand with caliche ; sand--very fine to fine grained, minor clay, well sorted; moderate-orange-pink (5YR8/4); moderately compacted, loose and weakly cemented, weakly to moderately cemented in central zone, caliche abundant except in 1.3 ft central zone where it is absent, strong reaction with HCl; slightly moist, very moist where caliche is absent -----	166.9-174
No recovery -----	174-177
Silty sand with caliche ; sand--very fine to fine grained, minor clay, 181.1-181.4 ft has pebbles 1% grading downward to 10% and \leq 12 mm, 75 mm cobble at 181.1 ft, pebbles--subangular, few subrounded, well sorted; sand--arkosic, pebbles--mafic, cobble--limestone; moderate brown (5YR4/4), 181.1-181.4 ft--grayish orange (10YR7/4); poorly laminated; moderately to strongly compacted and moderately cemented with CaCO ₃ , caliche as matrix, 181.1-181.4 ft--caliche also as nodules \leq 6 mm, blebs and stringers, strong reaction with HCl; very moist; abrupt basal contact -----	177-182.8
No recovery -----	182.8-187
Silty sand with clay ; sand--very fine to fine grained, well sorted; moderate brown (5YR4/4), light brown (5YR6/4) in central section; poorly laminated; moderately compacted/cemented with CaCO ₃ , caliche occurs as matrix with greatest content in central section, strong reaction with HCl; very moist; gradational basal contact -----	187-193.6
Sandy silty clay ; sand--very fine to fine grained, very well sorted; moderate brown (5YR4/4); moderately to strongly compacted, no reaction with HCl; very moist to saturated -----	193.6-194.5
Silty sand with clay and caliche ; sand--very fine to fine grained, pebbles 5% near basal contact, otherwise scattered, < 1% and \leq 25 mm, subangular, few subrounded; pebbles--granite, feldspar quartz, limestone, sandstone; light brown (5YR6/4); poorly laminated; moderately compacted/cemented with CaCO ₃ cement, caliche occurs as matrix, blebs and nodules \leq 8 mm near base of interval, strong reaction with HCl; very moist -----	194.5-200.5
No recovery -----	200.5-204
Clayey silty sand ; sand--very fine to medium grained, well sorted; dark-yellowish-brown (10YR4/2); poorly laminated; moderately compacted, slightly to moderately cemented with CaCO ₃ , strong reaction with HCl; moderately moist (upper 1.0 ft wet, probably due to seeping water) -----	204-206

Table 10.--Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
No recovery	206-207
Pebbly silty sand with caliche; sand--very fine to fine grained, pebbles 15-20% and \leq 50 mm, predominately \leq 15 mm, 110 mm cobble at approximately 216.2 ft, small pebbles--angular, larger pebbles--subangular, few subrounded, poorly sorted; pebbles--limestone, granite, quartz, mafics, sandstone, cobble--quartzite; light brown (5YR6/4); 212-216.4 ft is poorly laminated and central portion contains silty sand with minor caliche; 207-212 ft--powdery, 212-216.4 ft--moderately compacted and moderately cemented with CaCO ₃ to loose near base with caliche zones strongly cemented, caliche as matrix and as a 70 mm thick sandy zone with blebs above 216.4 ft, strong reaction with HCl; 207-212 ft--moderately moist, 212-216.4 ft--slightly to moderately moist; abrupt basal contact	207-216.4
Silty sand with minor caliche; sand--very fine to medium grained, well sorted; light brown (5YR6/4); poorly laminated; moderately compacted, slightly cemented, caliche as matrix, strong reaction with HCl; moderately moist	216.4-218.3
No recovery	218.3-220
Silty sand with caliche; sand--220-223.3 ft is very fine to fine grained, 223.3-235.5 ft is very fine to medium grained to very fine to fine grained in lower central section, well sorted; light brown (5YR6/4) to moderate brown (5YR4/4); 223.3-235.5 ft--poorly laminated to laminated in lower section; finer grained sand zones are powdery with abundant caliche, some weakly to moderately cemented with CaCO ₃ , moderately to strongly compacted / cemented towards bottom, caliche as matrix and as 5-40 mm nodules and few scattered blebs towards bottom of section, strong reaction with HCl; moderately moist	220-235.5
Sand with silt and caliche; sand--very fine to medium grained with some coarse to very coarse grains, pebbles < 2% and < 4 mm mostly in scattered zones; pebbles--limestone, quartz, shale; light brown (5YR6/4); some core fragments are well laminated; moderately cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl; moderately to very moist; abrupt basal contact due to cementation	235.5-240
Silty sand with caliche; sand--very fine to fine grained with minor coarse to very coarse grains, pebbles < 1% and < 4 mm, basal 0.2 ft--pebbles 30% and < 40 mm, subangular to subrounded; pebbles--limestone, quartzite; light brown (5YR6/4); loose, caliche as matrix, strong reaction with HCl; slightly moist; abrupt basal contact	240-243.9
Silty sand with pebbles; sand--very fine to medium grained, coarser to very coarse sand grains where pebbly, pebbles < 7% and < 4 mm in central and lower central sections, pebbles 30 to 60 mm near central section, subangular; pebbles--quartzite, limestone; light brown (5YR 6/4); poorly to well laminated; moderately compacted, weakly to moderately cemented with CaCO ₃ , caliche minor and occurs as matrix and as blebs in central and lower central section, strong reaction with HCl; moderately moist	243.9-247

Table 10.—Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
Sand with silt and caliche; sand--247-249.9 ft--very fine to fine grained, 249.9-255.7 ft--very fine to medium grained, pebbles minor and occur as scattered clasts < 6 mm, one 25 mm clast in lower section, angular to subangular, matrix--well sorted; smaller pebbles--limestone, large pebble--quartzite; light brown (5YR6/4); sandier sections well laminated; powdery with nodules of sand in upper section, moderately to strongly cemented with CaCO ₃ in lower section, caliche occurs as matrix and as few blebs in lower section, strong reaction with HCl; moderately moist -----	247-255.7
No recovery -----	255.7-259
Silty sand with caliche and clay; sand--very fine to fine grained or very fine to medium grained, few pebbles scattered and < 30 mm, 25 mm lens near 275 ft contains coarse to very coarse sand grains, sand and pebbles--subangular to subrounded, some angular sand grains, very well sorted from 259-261.5 ft; coarser sands--arkosic with mica, finer pebbles--limestone, coarser pebbles--quartzite; 259-261.5 ft--light brown (5YR6/4), 261.5-278.9 ft--light brown (5YR5/6), moderate brown (5YR4/4) where clayey; clayey areas well laminated, horizontal bedding (probably disturbed by drilling), clay and silt content increase towards bottom, 275-278.9 ft has poorly to well defined bedding in coarser sands; upper and central sections powdery/loose, otherwise moderately to strongly compacted and moderately cemented with CaCO ₃ , caliche occurs as matrix and as minor nodules < 8 mm in central and lower sections or minor stringers and blebs in lower section, strong reaction with HCl; 259-261.5 ft--slightly moist, 261.5-278.9 ft--moderately to very moist -----	259-278.9
No recovery -----	278.9-281
Silty sand with caliche; sand--very fine to medium grained with 5% coarse to very coarse grains, pebbles occur as few scattered clasts < 50 mm, 285.9-286.3 ft--pebble and cobble zone with pebbles and cobbles 30-100 mm, sand--angular to subangular, some subrounded, poorly sorted to well sorted towards bottom; sand--arkosic, pebbles--quartzite, limestone, weathered gneiss, cobbles--limestone; 281-285.9 ft--light brown (5YR5/6), 286.3-293.2 ft--grayish orange (10YR7/4); 281-285.9 ft--loose to powdery with many nodules of matrix strongly cemented with CaCO ₃ , 286.3-293.2 ft--moderately compacted and poorly to moderately cemented with CaCO ₃ , caliche as matrix and blebs, strong reaction with HCl; 281-285.9 ft--slightly to moderately moist, 285.9-293.2 ft--moderately to very moist; abrupt basal contact -----	281-293.2
Pebbly silty sand; sand--very fine to fine grained with 15% medium to very coarse grains, pebbles 15% and 20 to 60 mm recovered in the lower section, pebbles and coarser sand--angular, few subrounded, poorly sorted; sand--arkosic, pebbles--limestone, quartzite; grayish-orange-pink (5YR7/2); powdery, strong reaction with HCl; moderately moist; abrupt basal contact -----	293.2-294.6
Silty sand with clay and caliche; sand--very fine to medium grained or very fine to fine grained where clayey, well sorted, clay content increases and sand content decreases towards bottom; light brown (5YR6/4), light brown (5YR5/6) where clayey; moderately laminated from 294.6-296 ft; moderately compacted, weakly to strongly cemented with CaCO ₃ , caliche occurs as distorted bands of indurated sand from approximately 294.6-295 ft, and as matrix, blebs, and minor nodules < 8 mm in rest of section, strong reaction with HCl, moderate reaction where clayey; moderately to very moist -----	294.6-303.8

Table 10.--Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
No recovery -----	303.8-307
Sand with clay and pebbles; sand--very fine to mostly medium grained with 20% coarse to very coarse grains, pebbles 5% and < 30 mm, predominately < 15 mm, sand--subangular, pebbles--subangular to subrounded, poorly sorted; sand--arkosic, pebbles--limestone, quartzite, granite, tuff; moderate-yellowish-brown (10YR5/4); moderately compacted, moderate to strong reaction with HCl; moderately moist -----	307-308
Clayey sand with pebbles; sand--very fine to mostly medium grained with 20% coarse to very coarse grains, pebbles 12% and < 30 mm, predominately < 15 mm, 2 pebbles < 50 mm in center of section, subangular to subrounded; sand--arkosic, pebbles--limestone, quartzite; section contains zones of sandy clay with pebbles; moderately compacted, moderate reaction with HCl; very moist; abrupt basal contact -----	308-311
Pebbly sand with silt; sand--very fine to very coarse grained in upper section and very fine to mostly medium grained in lower section, pebbles 25% in upper section and \leq 8 mm, subangular, few subrounded, pebbles decrease and silt increases towards bottom; sand--arkosic, pebbles--limestone, feldspar, quartzite; moderate-yellowish-brown (10YR5/4); moderately compacted to powdery in central section, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; moderately to very moist -----	311-318
Pebbly silty sand; sand--very fine to very coarse grained, pebbles 20% and < 40 mm, predominately < 10 mm, subangular to subrounded; sand--arkosic, pebbles--limestone, quartzite; light brown (5YR6/4); loose to moderately cemented with CaCO ₃ , strong reaction with HCl; moderately moist to very moist where sandy -----	318-321.6
Silty sand; sand--very fine to mostly medium grained with 5% coarse to very coarse grains, subangular to subrounded, well sorted; sand--arkosic; moderate-yellowish-brown (10YR5/4); moderately compacted, weakly cemented with CaCO ₃ , strong reaction with HCl; very moist -----	321.6-323
Pebbly sand with clay and cobbles; sand--very fine to mostly medium grained, pebbles 10% < 6 mm and 10% 6 to 60 mm, cobbles < 100 mm (broken by drilling), sand--angular, few subangular, pebbles and cobbles--angular to subangular, few subrounded, very poorly sorted; sand--arkosic, pebbles and cobbles--quartzite, limestone, minor greenstone and schist; dark-yellowish-brown (10YR4/2); weakly to moderately cemented with CaCO ₃ , moderate reaction with HCl; very moist; fairly abrupt basal contact -----	323-325
Pebbly silty sand with caliche; sand--very fine to fine grained, pebbles 15% and < 40 mm, predominately < 15 mm, angular, few subrounded, pebbles concentrated in the lower section (probably due to drilling); pebbles--quartzite, limestone, greenstone; pale-yellowish-brown (10YR6/2); powdery, with frequent nodules moderately cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl; moderately moist; abrupt basal contact -----	325-328.7

Table 10.--Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
Silty sand with clay; sand--very fine to medium grained, scattered zones of clayey silty sand--sand is very fine to fine grained, caliche abundant as matrix from 344-346 ft; 327.7-344 ft--light brown (5YR6/4), 344-346 ft--moderate-orange-pink (5YR8/4); 327.7-344 ft--poorly laminated, gradational upper central and lower central zones of clayey silty sand; moderately compacted, sandy sections are weakly cemented with CaCO ₃ , caliche occurs as minor matrix and thin stringers in central and upper lower section and as a 50 mm zone about 3 ft from top of section, slightly to strongly cemented from 344-346 ft, caliche abundant as matrix from 344-346 ft, moderate to strong reaction with HCl, weak reaction where clayey; 327.7-344 ft--very moist, moderately to very moist -----	328.7-346
No recovery -----	346-348
Silty sand with caliche; sand--very fine to fine grained with central and lower zones containing very fine to medium grains, pebbles < 1% and < 10 mm, one 40 mm clast, pebbles occur in three 10 mm lenses in center section, pebbles--angular to subangular, 40 mm pebble--subangular; sand--arkosic, pebbles--limestone, quartz, feldspar, granite, greenstone, 40 mm pebble--limestone; grayish orange (5YR7/2); moderately compacted and weakly cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl, lenses within 50 to 70 mm zones of sand strongly cemented with CaCO ₃ ; moderately moist; gradational basal contact -----	348-353.5
Clayey silty sand; sand--very fine to mostly medium grained, well sorted, section contains zones of sandy silty clay; moderate-yellowish-brown (10YR5/4); moderately compacted, slightly cemented with CaCO ₃ , moderate reaction with HCl in upper section, weak to moderate reaction in lower section; very moist -----	353.5-358
Clayey silt with sand and caliche; sand--very fine to fine grained in matrix, coarser grained when with pebbles in lenses and zones, pebbles < 2% and < 8 mm, pebbles--angular, few subrounded; pebbles--limestone, feldspar; moderate brown (5YR4/4); poorly to moderately laminated where pebbly; moderately compacted, weakly to moderately cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl; moderately moist; abrupt basal contact -----	358-360
Clayey silty sand; sand--very fine to fine grained; moderate brown (5YR4/4); moderately compacted, weakly cemented with CaCO ₃ , moderate to strong reaction with HCl; very moist-----	360-362
No recovery -----	362-365
Silty sand; sand--very fine to medium grained; sand--arkosic; moderate-yellowish-brown (10YR5/4); moderately compacted, moderately cemented with CaCO ₃ , moderate reaction with HCl; very moist; abrupt basal contact -----	365-367.2
Sandy silt with caliche; sand--very fine to fine grained, 65 mm cobble, subangular; sand--arkosic, cobble--limestone; moderate-orange-pink (5YR8/4); sand in lower section is laminated; loose, very weakly cemented in lower section, sandy nodules 20% and < 30 mm are strongly cemented with CaCO ₃ , caliche as matrix, strong reaction with HCl; moderately moist -----	367.2-368.4

Table 10.--Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
Clayey silty sand; sand--very fine to fine grained; sand--arkosic; moderate-yellowish-brown (10YR5/4); moderately compacted, moderately cemented with CaCO ₃ , moderate reaction with HCl; very moist; abrupt basal contact -----	368.4-369.5
Silty sand with caliche; sand--very fine to medium grained; sand--arkosic; moderate-orange-pink (5YR8/4); moderately compacted, moderately cemented with CaCO ₃ , caliche occurs as matrix, poorly defined blebs, and stringers, moderate reaction with HCl; very moist -----	369.5-370.6
No recovery -----	370.6-374
Silty sand with caliche; sand--very fine to mostly medium grained with 5% coarse to very coarse grains, pebbles 2% and < 10 mm, subangular; sand--arkosic, pebbles--quartzite; light brown (5YR6/4); moderately compacted, weakly to moderately cemented with CaCO ₃ , caliche minor and occurs as stringers, strong reaction with HCl; very moist -----	374-376
Silty clayey sand; sand--very fine to medium grained; sand--arkosic; light brown (5YR5/6); moderately compacted, weakly to moderately cemented with CaCO ₃ , strong reaction with HCl; very moist; gradational basal contact -----	376-378.1
Silty sand with caliche, pebbles and cobbles; sand--very fine to fine grained or very fine to medium grained in central section, pebbles < 40 mm, cobbles < 100 mm, pebbles and cobbles--subangular with many fresh breaks (due to drilling), clasts are in zones of finer sand sizes and with higher caliche content; sand--arkosic, pebbles and cobbles--quartzite, limestone, metagranite; matrix--dark-yellowish-orange (10YR6/6); sandy sections are poorly laminated; moderately compacted, weakly to strongly cemented with CaCO ₃ (for one 30 mm lens), caliche as matrix, strong reaction with HCl; moderately moist to very moist where sandy; abrupt basal contact -----	378.1-385.4
Clayey silty sand; sand--very fine to mostly medium grained; sand--arkosic; moderate-yellowish-brown (10YR5/4); poorly laminated; moderately compacted, moderately cemented with CaCO ₃ , moderate reaction with HCl; very moist -----	385.4-390.7
No recovery -----	390.7-394.5
Clayey sand; sand--very fine to medium grained, nodules < 2% and 10 to 40 mm or as a disturbed 50 mm lens, nodules are very fine to mostly medium grained sand with some coarse to very coarse grains; sand--arkosic, nodules--sandstone; moderate brown (5YR3/4); gradational sandy clay in the upper section; moderately compacted, moderately cemented with CaCO ₃ , moderate to strong reaction with HCl, nodules are very hard, strong reaction with HCl; very moist; fairly gradational basal contact -----	394.5-399
Pebbly silty sand with caliche; sand--very fine to medium grained with some coarse to very coarse grains, pebbles 8% < 8 mm and 7% 20 to 40 mm, subangular with fresh breaks (due to drilling); pebbles--quartzite, limestone; grayish orange (10YR7/4); 1 mm laminations where sandy; loose to moderately cemented with CaCO ₃ , caliche occurs as matrix and is abundant in lower central section, strong reaction with HCl; varies downward from very moist to moderately moist; gradational basal contact -----	399-403

Table 10.--Lithology penetrated by borehole LWDS-MW2--Continued

Lithologic description	Depth interval above land surface (feet)
Clayey silty sand with caliche; sand--very fine to medium grained, well sorted; sand--arkosic; moderate brown (5YR4/4); poorly laminated; moderately compacted, moderately cemented with CaCO ₃ , caliche as matrix, moderate to strong reaction with HCl; very moist -----	403-411
Silty sand with clay and caliche; sand--very fine to medium grained, well sorted; sand--arkosic; moderate-yellowish-brown (10YR5/4); 1 mm laminations; moderately compacted, weakly to moderately cemented with CaCO ₃ , caliche occurs as matrix and is abundant in central and lower section, also occurs as minor nodules < 8 mm, strong reaction with HCl; moderately to very moist -----	411-419
Clayey silty sand with caliche; sand--very fine to medium grained, pebbles < 2% and 10 to 25 mm and scattered in upper interval, subangular, matrix is well sorted; sand--arkosic, pebbles--limestone, minor quartzite; moderate-yellowish-brown (10YR5/4); moderately compacted, weakly to moderately cemented with CaCO ₃ , minor caliche as matrix, moderate reaction with HCl; very moist -----	419-421.6
No recovery -----	421.6-425
Clayey silty sand; sand--very fine to fine grained, cobble 100 mm, cobble--angular to subangular (probably due to drilling); sand--arkosic, cobble--sandstone similar to lenses found previously; moderate-yellowish-brown (10YR5/4); moderately compacted, moderately cemented with CaCO ₃ , strong reaction with HCl; very moist; gradational basal contact -----	425-427
Sandy silt with caliche; sand--very fine to fine grained; moderate-orange-pink (5YR8/4); powdery, caliche as matrix, strong reaction with HCl; moderately moist; abrupt basal contact -----	427-428.6
Clayey silty sand; sand--very fine to fine grained, pebbles < 2% and ≤ 12 mm, 80 mm cobble occurs at bottom of section (surface worn by drilling), subangular; sand--arkosic, pebbles--limestone, metagranite; cobble is partial 60 mm lens of sandstone; 428.6-430 ft--moderate-yellowish-brown (10YR5/4), 430-435.2 ft--light brown (5YR5/6); moderately compacted, 428.6-430 ft--moderately cemented with CaCO ₃ , 428.6-430 ft--strong reaction with HCl, 430-435.2 ft--moderate to strong reaction with HCl; very moist to saturated at bottom -----	428.6-435.2
Sandy clayey silt with caliche; sand--very fine to fine grained, pebbles < 3% and ≤ 40 mm, subangular, few subrounded; pebbles--quartzite, limestone, minor granite and gneiss; light brown (5YR5/6); upper section--loose, otherwise moderately to strongly compacted, caliche as matrix, strong reaction with HCl; very moist, saturated where sandy -----	435.2-444.1
Silty sand with clay; sand--very fine to medium grained, pebbles < 1% and < 10 mm, subangular; sand--arkosic, pebbles--quartzite, limestone; light brown (5YR5/6); thinly laminated < 1 mm; moderately compacted, moderate to strong reaction with HCl; very moist, close to saturation -----	444.1-447.1
No recovery -----	447.1-450
Clayey silty sand; sand--very fine to medium grained, pebbles < 1% and < 10 mm, subangular; sand--arkosic, pebbles--quartzite, limestone; light brown (5YR5/6); thinly laminated < 1 mm; moderately compacted, lower 1 ft--strongly compacted, moderate to strong reaction with HCl; very moist, close to saturation -----	450-460.6

Table 10.--Lithology penetrated by borehole LWDS-MW2--Concluded

Lithologic description	Depth interval above land surface (feet)
Sand with clay and silt; sand--very fine to fine grained, well sorted; moderate-yellowish-brown (10YR5/4); moderately compacted, moderate reaction with HCl; saturated; fairly abrupt basal contact -----	460.6-463.7
Clayey silty sand; sand--very fine to fine grained, well sorted; light brown (5YR5/6); moderately to strongly compacted, moderate to strong reaction with HCl; saturated -----	463.7-475.3
Clayey sand with silt; sand--very fine to fine grained, well sorted; moderate-yellowish-brown (10YR5/4); moderately compacted, moderate reaction with HCl; saturated -----	475.3-477
Sand with clay and silt; sand--very fine to fine grained, well sorted; moderate-yellowish-brown (10YR5/4); strongly compacted, moderate reaction with HCl; saturated -----	477-484.7
Clayey silty sand; sand--very fine to fine grained, well sorted; moderate-yellowish-brown (10YR5/4); strongly compacted, moderate reaction with HCl; saturated -----	484.7-487.2
Silty sand with clay; sand--very fine to fine grained, pebbles 3% < 10 mm and 2% 10 to < 50 mm, angular, few subrounded, becomes less silty towards bottom; pebbles--quartzite, limestone, sandstone; moderate brown (5YR4/4); moderately to strongly compacted, moderate to strong reaction with HCl; saturated ----	487.2-489.8
Pebbly sandy silt with cobbles and caliche; sand--very fine to fine grained, pebbles and cobbles 20% and ≤ 80 mm, angular to subangular (many clasts probably fractured by drilling); pebbles and cobbles--limestone, quartzite; varies downward from light brown (5YR6/4) to very-pale-orange (10YR8/2); moderately compacted to powdery in lower section, caliche as matrix, strong to very strong reaction with HCl; saturated(?) to very moist(?) where powdery; abrupt basal contact -----	489.8-492.4
Clayey sand with silt; sand--very fine to fine grained, well sorted, silt and clay decrease towards bottom grading to sand with clay; moderate-yellowish-brown (10YR5/4); strongly compacted, moderate reaction with HCl; saturated -----	492.4-497
No recovery (recovered as rock-bit cuttings; driller reported sample was not reliable, therefore reporting as no recovery) -----	497-507
Pebbles in silty sandy clayey matrix (recovered as rock-bit cuttings); sand--very fine to fine grained, pebbles ≤ 40 mm recovered as freshly broken clasts with few intact, pebbles--subangular, few subrounded; pebbles--quartzite, limestone; matrix--moderate-yellowish-brown (10YR5/4); scattered globs of extremely soft silty clay (saturated), dried matrix has moderate to strong reaction with HCl; recovered as slurry (water producing zone) -----	507-530
Clayey silty sand; sand--very fine to fine grained, few scattered pebbles < 12 mm, subangular to subrounded; pebbles--limestone; moderate-yellowish-brown (10YR5/4); moderately to firmly compacted, moderate to strong reaction with HCl; saturated -----	530-531

Borehole Location:

Logged By: D.W. PABER

Instruments: PID

Task Leader: Lon Dawson

Drill Rig: Trilling F-10

Drilling Contractor: Stewart

Ground Elev (ft, MSL)

Driller/Helper: Stanley, Lawrence, Chief

Drilling Method: HCA

Sample Method: Split Spoon

Hammer Weight/Drop: 120/30

Borehole Diameter: 6"

Start Time: 12/1 11:30

Date: 12/1

Finish Time:

Date: 12/1

Notes: Sunny

^apCi/L = Picocuries per liter.

^bMCL = Maximum Contaminant Level, U.S. Environmental Protection Agency; National Primary Drinking Water Regulations; Title 40 Code of Federal Regulations, Section 141.

^cDOE Guideline, U.S. Department of Energy, "Radiation Protection of the Public and the Environment," DOE 5400-5, 02-08-90, Chapter III; U.S. Department of Energy, Washington, D.C.

^dMAC = Maximum Allowable Concentration, New Mexico Water Quality Control Commission; New Mexico Water Quality Control Commission Regulations, Part 3, Section 103, August 1991.

^eMCL is 5 pCi/L for radium-226 and radium-228 combined.

^fMAC is 30.0 pCi/L for radium-226 and radium-228 combined.

^gValue is based on a 4 millirem annual dose equivalent for photon radioactivity.

^hNE = Not established.

Table 14a
Summary Of Chemical Analysis Results,
SNL/NM TA-5 Groundwater Monitoring Project, LWDS-MW1,
Calendar Year 1995

^aDate of sample collection.

^bmg/L = Milligrams per liter.

^cValues in parentheses are the maximum contaminant levels (in mg/L) established by the U.S. Environmental Protection Agency (EPA) Primary Drinking Water Regulations (PDWR) in 40 CFR 141.11b, subsequent amendments, or the New Mexico Environmental Improvement Board in the New Mexico Register, Title 20, Chapter 7, Part 1.

^dSU = standard pH units.

^eNA = Not analyzed or not applicable.

^fND = Not detected above the associated quantitation limit shown in parentheses.

^gNo MCL is established for lead in drinking water. The action level is 0.015 mg/L, and that value is treated as an MCL for this report.

^hOnly identified compounds are reported.

ⁱB = Compound also detected in a laboratory or field blank sample.

^jJ = Estimated concentration value less than the quantitation limit.

^aDate of sample collection.

^bNA = Not analyzed or not applicable; total metals and SVOCs only collected and analyzed annually, organic compounds and nitrate analyzed quarterly.

^cValues in parentheses are the maximum contaminant levels (MCLs, in mg/L) established by the U.S. Environmental Protection Agency (EPA) Primary Drinking Water Regulations (PDWR) in 40 CFR 141.11(b), subsequent amendments, or the New Mexico Environmental Improvement Board in the New Mexico Register, Title 20, Chapter 7, Part 1.

^dB = Compound also detected in a laboratory or field blank sample.

^eSNL/NM onsite laboratory analytical results.

^fOffsite laboratory analytical results.

^gSU = standard pH units; pH measured in field; reported value measured prior to sampling.

^hJ = Estimated concentration value less than the quantitation limit.

ⁱND = Not detected above the associated quantitation limit shown in parentheses.

^jNo MCL is established for lead in drinking water. The action level is 0.015 mg/L, and that value is treated as an MCL for this report.

^kWhere onsite and offsite data are available for the same well, the highest concentration is reported.

Tim Goering, MS-1148 (6134)

subject: Submittal of Liquid Waste Disposal System Cross Sections for the LWDS Request for Supplemental Information

Attached are vertical cross-sections showing the distributions of contaminants in subsurface soils at the Liquid Waste Disposal System (LWDS). These figures are being submitted in response to General Comment No. 2 in the NMED's September 30, 1997 Request for Supplemental Information (RSI) regarding Sandia National Laboratories' OU 1307 RFI Report.

Cross Sections A-A' and B-B' extend beneath the LWDS surface impoundments (ER Site 4) as shown in Figure 1. Cross Section C-C' extends beneath the LWDS holding tanks (ER Site 52), and Cross Section D-D' extends beneath the LWDS drainfield (ER Site 5), as shown in Figure 2.

Contaminants shown in the cross sections were selected based on whether or not they exceeded the NMED-approved background values at ER Sites 4, 5, or 52. No cross sections were developed for constituents which did not exceed background values at a specific site.

Contaminant isopleths are shown on each cross-section. The isopleths were estimated by the geostatistical method kriging using the contouring program Surfer™. The actual contaminant distributions in the subsurface may vary considerably from those predicted by computer. However, these figures should provide a good indication of the relative distribution of contaminants in the subsurface soils beneath the LWDS.

The locations of soil samples are marked on each cross section with a "-", along with the measured contaminant concentrations in each sample. In addition, the NMED-approved background values for each contaminant are shown at the bottom of each figure.

Only one contaminant, copper, was plotted in Cross Section D-D'. No other contaminants were plotted for this cross section, because they had already been plotted in the "Results of the Liquid Waste Disposal System RCRA Facility Investigation, Sandia National Laboratories, Albuquerque, New Mexico" (SNL, 1995). These cross sections are presented in Figures 4-7 through 4-11 in the LWDS RFI report.

If you have any questions, please call Tim Goering at 284-2563.

Thank you.

Sandia Site Office
P.O. Box 5400
Albuquerque, New Mexico 87185-5400

JUN 1 6 2005

CERTIFIED MAIL - RETURN RECEIPT REQUESTED

Mr. James Bearzi, Bureau Chief
New Mexico Environment Department
Hazardous Waste Bureau
Permits Management Program
2905 Rodeo Park Road, Building 1
Santa Fe, NM 87505

CC:
ES/ISEC
MS

Dear Mr. Bearzi:

On behalf of the Department of Energy (DOE) and Sandia Corporation, DOE is submitting a copy of the supplemental residential risk screening results for solid waste management units (SWMUs) 4, 5, 52, 233, and 234 identified as SWMUs under the Hazardous and Solid Waste Amendments Module of the Resource Conservation and Recovery Act (RCRA) Permit for Sandia National Laboratories, New Mexico (EPA ID No. NM5890110518).

SWMUs 4, 5 and 52 are part of the Liquid Waste Disposal System (LWDS) Operable Unit in Technical Area III/IV. The original No Further Action (NFA) Proposals for SWMUs 4, 5, and 52 were submitted to the New Mexico Environment Department (NMED) as part of the RCRA Field Investigation (RFI) for the LWDS in September 1995. Additionally, a response was submitted to NMED in January 1998 and October 1998 to each of two separate Requests for Supplemental Information (RSIs) for SWMUs 4, 5 and 52. A third response to an RSI request was submitted to NMED in May 2001 for SWMU 52. In December 2002, supplemental RSI information was summarized and provided to NMED for SWMU 5.

SWMUs 233 and 234 are part of the Tijeras Arroyo Operable Unit. The original NFA proposals for SWMUs 233 and 234 were submitted to NMED in June 1995 as part of the Round 2 NFA submittals. Additionally, responses were submitted to NMED in October 1996, December 1999, and December 2000 for three separate RSIs.

The enclosed information updates the residential risk screening results for these five SWMUs to achieve consistency with the methodology currently used by the Sandia ER Project and is provided to the NMED to support a determination of Corrective Action Complete Without Controls for these five sites.

The Compliance Order on Consent (COOC) contains deliverable dates for Investigation Reports related to two of these sites: SWMU 4 by March 31, 2006; and SWMU 52 by September 30, 2004. For each of these sites, the previously submitted NFA proposals and RSI responses (referenced above) satisfy these deliverables as indicated by footnote 1 to Table XI-3 of the COOC. No further site-specific investigations have been undertaken at either of these SWMUs, eliminating the need

Mr. J. Bearzi

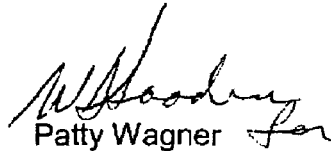

(2)

JUN 16 2005

for additional investigation reporting. The information included with this submittal is limited to updated residential risk screening results using current methodology.

If you have any questions, please contact John Gould at (505) 845-6089.

Sincerely,

Patty Wagner
Manager

SWMU 4: RISK ASSESSMENT REPORT

I. Site Description and History

Solid Waste Management Unit (SWMU) 4, the Liquid Waste Disposal System (LWDS) Surface Impoundments, is located northwest of Sandia National Laboratories/New Mexico (SNL/NM) Technical Area (TA)-V (Figure 1). The LWDS consisted of three individual SWMUs including SWMU 52, the Holding Tanks; SWMU 5, the Drainfield; and SWMU 4, the Surface Impoundments (Figure 2).

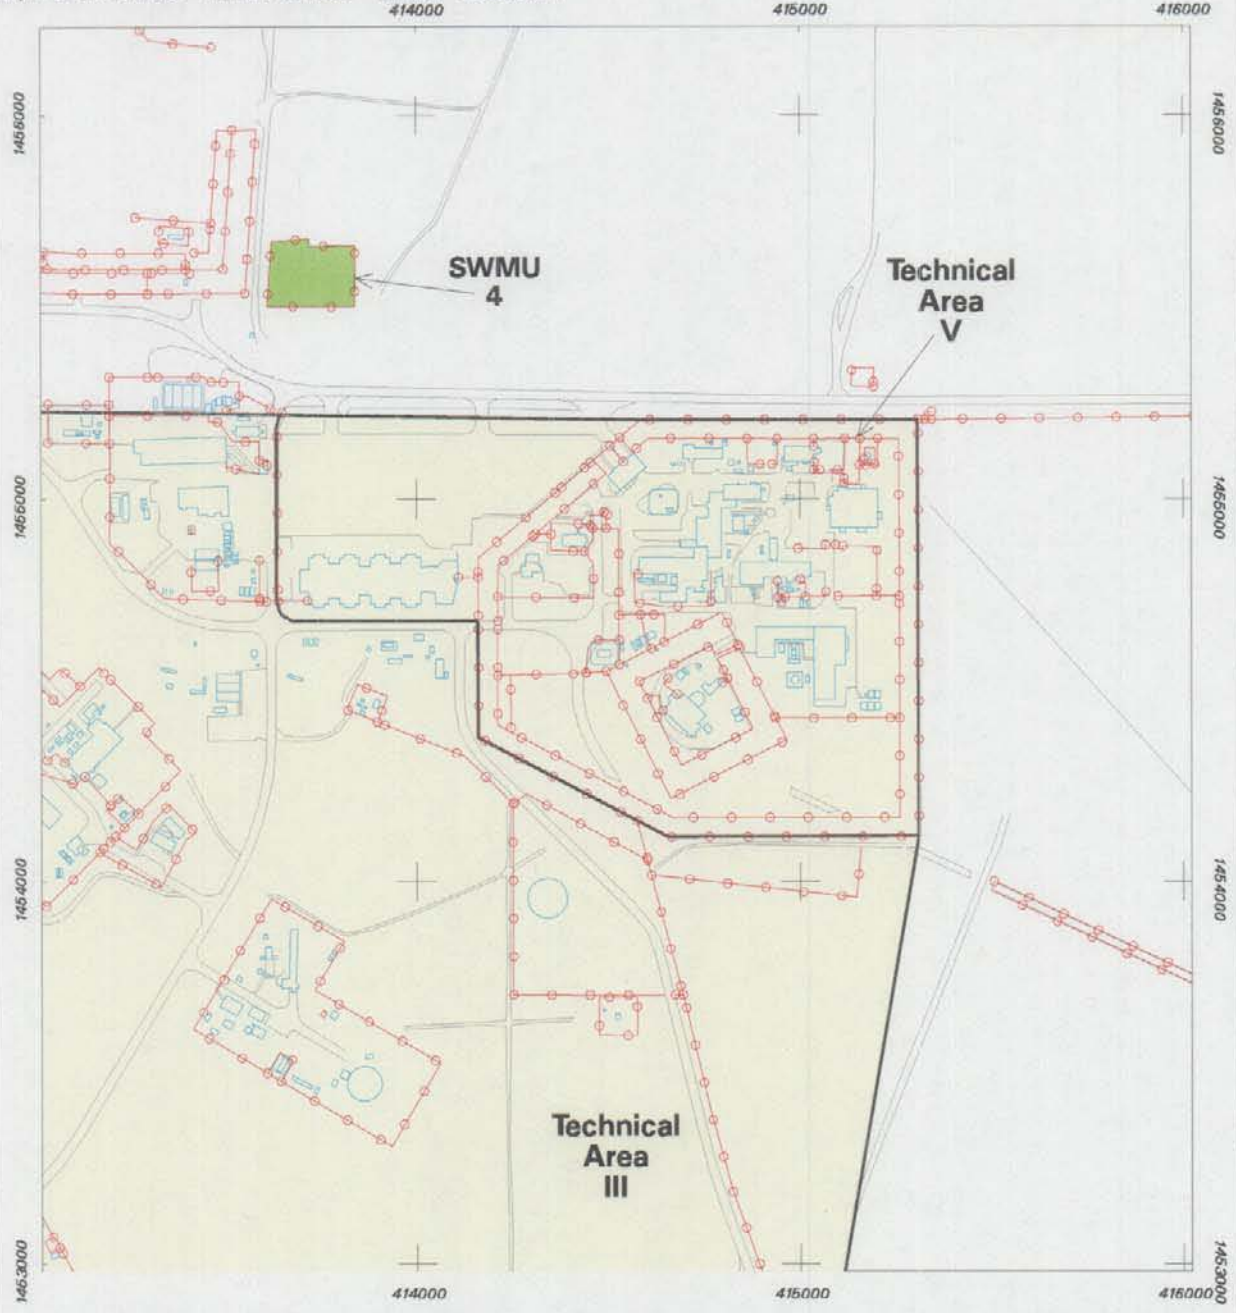

SWMU 4 consists of two unlined surface impoundments constructed to receive coolant water discharges from the Sandia Engineering Reactor Facility (SERF) and possibly contaminated waste water from experiments and operations in the SERF buildings. Beginning in 1963, radioactive discharges drained to the holding tanks, were monitored and then pumped to the drainfield. When the drainfield collapsed in 1967, discharges were directed to the impoundments. Radioactive discharges continued until 1970, and in 1971, the SERF was decommissioned. Nonradioactive discharges continued until 1992. In September 1983, one or both of the impoundments were used by the U.S. Air Force as a "decontamination catch bin" for undocumented purposes. Soil and sludge samples collected in 1984 showed 26.4 parts per million of polychlorinated biphenyls (PCBs) in one of the impoundments. These samples were not collected by SNL/NM's Environmental Restoration (ER) project. The conditions of sample collection are not known and documentation of results cannot be located.

The impoundments were constructed after the collapse of the LWDS drainfield (SWMU 5). Impoundment 1, the eastern impoundment, was constructed in June 1967, encompasses approximately 8,100 square feet, measures 65 by 125 feet, and is 12 feet deep. Impoundment 2 was constructed in June 1970 to the west of Impoundment 1, encompasses approximately 9,400 square feet, measures 102 by 92 feet, and is 20 feet deep. Waste oil and resin beads were disposed in the eastern impoundment on at least one occasion. The volume and radionuclide content of the discharges to the impoundments were monitored and recorded between 1967 and 1971. It is estimated that approximately 12 million gallons of waste water containing approximately 14 curies of measured radioactivity were discharged to the impoundments. After July 1971, reporting requirements were relaxed, and the impoundments continued to receive intermittent waste water discharges from sinks and floor drains in the Hot Cell Facility.

The vicinity of SWMU 4 is unpaved, and no storm sewers are used to direct surface water. Other than the surface impoundments themselves, there is no development on the site. Fencing surrounds the site, and signs are posted that identify the area as an ER site.

The annual precipitation for the area, as measured at Albuquerque International Sunport, is 8.1 inches (NOAA 1990). No springs or perennial surface-water bodies are located within 2 miles of the site. During most rainfall events, rainfall quickly infiltrates the soil at SWMU 4. However, virtually all of the moisture subsequently undergoes evapotranspiration. The estimates of evapotranspiration for the Kirtland Air Force Base (KAFB) area range from 95 to 99 percent of the annual rainfall (SNL/NM March 1996).

Figure 2
Location of SWMUs 4, 5, and 52

Sandia National Laboratories, New Mexico
Environmental Geographic Information System

Groundwater monitoring for the area surrounding SWMU 4 is conducted as part of the TA-V Groundwater Investigation. Thirteen monitoring wells are located within 1 mile of SWMU 4. The regional aquifer is approximately 480 to 500 feet below ground surface (bgs) (SNL/NM March 2003). Both the City of Albuquerque and KAFB use the regional aquifer for water-supply purposes. The nearest water supply well, KAFB-4, is located approximately 2 miles north of SWMU 4, although it is not used on a regular basis. Because the TA-V Groundwater area of concern is regulated separately under the Compliance Order on Consent (NMED 2004), the SWMU 4 site investigation and risk assessment do not address groundwater issues.

In 1992, the ER Project began work on the SWMU 4 LWDS Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) (SNL/NM September 1995) that included surface radiation and organic vapor surveys as well as extensive surface and subsurface soil sampling. A grid system was established, and surface soil samples were collected from the center of each 10- by 10-yard square. Additional samples were collected from both the surface and at a depth of 1 foot at the drainage outfalls. Soil samples were analyzed at an off-site laboratory for volatile organic compounds (VOCs), semivolatile organic compounds (SVOCs), PCBs, metals, and radionuclides.

The RFI work continued later in 1992 and in 1994 with the advancement of nine soil boreholes in and around the SWMU 4 surface impoundments. In 1992, one groundwater monitoring well (LWDS-MW2) was installed north of the impoundments to a total depth of 531 feet bgs and screened between 506 to 526 feet bgs. This well is part of the TA-V monitoring well network and is sampled on a regular basis. Continuous core was collected from the boreholes, and soil samples were collected at approximately 5-foot intervals and submitted for laboratory analysis.

Analytical results of the LWDS RFI soil samples were compared with the New Mexico Environment Department (NMED)-approved background levels (Dinwiddie September 1997a) and 17 metals were found to be above background levels (antimony, arsenic, barium, beryllium, cadmium, total chromium, chromium VI, cobalt, copper, lead, mercury, nickel, selenium, silver, thallium, vanadium, and zinc). PCBs (Aroclor-1260) were detected in a surface sample at 0.071 milligrams (mg)/kilogram (kg). The U.S. Environmental Protection Agency (EPA) has set a screening level of 1 mg/kg for this site (Title 40, Code of Federal Regulations [CFR], Part 761). Detected organic compounds included acetone, benzene, benzo(a)anthracene, benzo(b)fluoranthene, bis(2-ethylhexyl) phthalate, 2-butanone, chrysene, fluoranthene, 2-hexanone, methylene chloride, PCBs, 4-methyl-2-pentanone, phenanthrene, pyrene, styrene, tetrachloroethene, and toluene. Elevated levels of radionuclides were also detected (Cs-137, Co-60, H-3, Pb-210, Ra-226, Th-232, U-235, and U-238).

A Request for Supplemental Information (RSI) was received from the NMED in 1997 (Dinwiddie September 1997b); this RSI indicated that additional information from the RFI sampling events was required. A response was prepared and submitted (SNL/NM January 1998) that addressed all concerns stated in the request.

II. Data Quality Objectives

The data quality objectives (DQOs) are presented in the LWDS RFI Work Plan (SNL/NM March 1993). The DQOs outline the quality assurance (QA)/quality control (QC) requirements necessary for producing defensible analytical data suitable for risk assessment purposes. The sampling conducted at SWMU 4 was designed to:

- Determine whether a release of constituents of concern (COCs) to the surface soil or subsurface soils beneath the surface impoundments has occurred above the action levels (or applicable approved background values).
- Determine whether a release of COCs above the action levels from SWMU 4 to the groundwater has occurred.

Table 1 summarizes the rationale for designing the sampling plan. Table 2 summarizes the sample collection and analyses performed for SWMU 4. The confirmatory soil samples were collected during two sampling events (in 1992 and 1994). Details of the collection and analytical results can be found in the September 1995 RFI Report (SNL/NM September 1995). The soil samples were analyzed for all COCs, including VOCs, SVOCs, PCBs, metals, and radionuclides.

The samples collected in 1992 were analyzed by Enseco (Quanterra) Laboratory (Enseco); the samples collected from the boreholes in 1994 were analyzed by Enseco, TMA Eberline, and the SNL/NM Radiation Protection Sample Diagnostics Laboratory. Table 3 summarizes the number of samples, the analytical methods, and data quality levels achieved as defined in the LWDS RFI work plan (SNL/NM March 1993).

Thirty-eight QA/QC samples were collected during both sampling events and consisted of 18 soil duplicate, 13 trip blank, and 7 aqueous equipment blank samples (Table 4). No significant QA/QC problems were identified in any of the QA/QC samples.

The 1992 and 1994 soil sample results were verified/validated by SNL/NM according to "Procedure for Validation of Chemical Measurement Data" SNL/NM Environmental Programs Department Procedure QA-11-01, Rev. 0 (SNL/NM October 1991). The reviews confirm that the data from the analytical laboratories are defensible and therefore acceptable for use in the proposal for no further action (NFA), fulfilling the DQO requirements.

III. Determination of Nature, Rate, and Extent of Contamination

III.1 Introduction

The determination of the nature, migration rate, and extent of contamination at SWMU 4 was based upon an initial conceptual model validated with confirmatory sampling at the site. The initial conceptual model was developed from archival research, soil sampling, soil-vapor surveys, aerial photographs, geophysical and radiological surveys. The DQOs contained in the LWDS RFI Work Plan (SNL/NM March 1993) identified the sample locations, sample density, sample depth, and analytical requirements. The quality of the data used to specifically determine the nature, migration rate, and extent of contamination is described in the following sections.

Table 1
Summary of Sampling Performed to Meet DQOs

SWMU 4 Sampling Areas	Potential COC Source	Number of Sampling Locations	Sample Density	Sampling Location Rationale
Surface soil samples in and near the surface impoundments collected in 1992	Discharge water from the LWDS holding tanks and/or KAFB one-time use	Samples collected from 48 points plus 2 sample locations at the drainage outfall	Sampling grid on a 10- by 10-yard spacing	Confirm that no significant levels of COCs exist in the surface and near-surface soil
Soil boreholes LWDS-BH-1 through LWDS-BH-5 drilled in 1992	Discharge water from the LWDS holding tanks and/or KAFB one-time use	Soil samples collected at various depths from 5 boreholes	Samples collected in each borehole at approximately 5-ft intervals	Confirm that no significant levels of COCs exist in the subsurface soil
Soil boreholes LWDS-BH-9, LWDS-BH-10, LWDS-BH-17, and LWDS-BH-18 drilled in 1994	Discharge water from the LWDS holding tanks and/or KAFB one-time use	Soil samples collected at various depths from 4 boreholes	Samples collected in each borehole at approximately 5-ft intervals	Confirm that no significant levels of COCs exist in the subsurface soil

BH = Borehole.
COC = Constituent of concern.
DQO = Data Quality Objective.
ft = Foot (feet).
KAFB = Kirtland Air Force Base.
LWDS = Liquid Waste Disposal System.
SWMU = Solid Waste Management Unit.

1992–Borehole Soil Samples	Duplicate	11
	Trip Blank	5
	Equipment Blank	5
1994–Borehole Soil Samples	Duplicate	2
	Trip Blank	2
	Equipment Blank	2

QA = Quality assurance.
QC = Quality control.

III.2 Nature of Contamination

Both the nature of contamination and the potential for the degradation of COCs at SWMU 4 were evaluated using laboratory analyses of the soil samples. The laboratory requirements included analyses for VOCs, SVOCs, PCBs, metals, and radionuclides, which characterized potential contamination at the site. The analytes and methods listed in Table 2 are appropriate for characterizing the COCs and potential degradation products at SWMU 4.

III.3 Rate of Contaminant Migration

SWMU 4 is an inactive site; therefore, all primary sources of COCs have been eliminated. As a result, only secondary sources of COCs potentially remain in the soil in the form of adsorbed COCs. The rate of COC migration from soil is, therefore, predominantly dependent upon precipitation into the impoundments. Data available from the TA-V Groundwater Investigation (SNL/NM November 2001); numerous SNL/NM monitoring programs for air, water, and radionuclides; and meteorological monitoring are adequate for characterizing the rate of COC migration at SWMU 4.

III.4 Extent of Contamination

Soil samples were collected from the surface and subsurface soil to a maximum depth of 100 feet bgs during the drilling activities at SWMU 4 in order to determine the vertical and horizontal extent of contamination. Extensive soil sampling was conducted within the boundaries of the surface impoundments, both at the surface and in the five boreholes. An additional four boreholes were advanced on each side of the impoundments. These soil samples are representative of the soil directly beneath, and adjacent to, the surface impoundments and are considered to be sufficient to determine the vertical extent, if any, of COCs.

In summary, the design of the confirmatory soil sampling plan was appropriate and adequate to determine the nature, migration rate, and extent of residual COCs in the surface and subsurface soil at SWMU 4.

IV. Comparison of COCs to Background Screening Levels

Site history and characterization activities are used to identify potential COCs. This document describes the identification of COCs and the sampling that was conducted in order to determine the concentration levels of those COCs across the site. Generally, COCs evaluated in this risk assessment include all detected organic and all radiological and inorganic COCs for which samples were analyzed. When the detection limit of an organic compound was too high (i.e., could possibly cause an adverse effect to human health or the environment), the compound was retained. Nondetected organic compounds not included in this assessment were found to have detection limits low enough to ensure protection of human health and the environment. In order to provide conservatism in this risk assessment, the calculation used only the maximum concentration value of each COC found for the entire site. The SNL/NM maximum background concentration (Dinwiddie September 1997a) was selected to provide the background screen listed in Tables 5, 6, and 7.

Nonradiological inorganic constituents that are essential nutrients, such as iron, magnesium, calcium, potassium, and sodium, were not included in this risk assessment (EPA 1989a). Both radiological and nonradiological COCs were evaluated. The nonradiological COCs included both organic and inorganic compounds.

Table 5 lists the nonradiological COCs for the human health risk assessment at SWMU 4. Table 6 lists the nonradiological COCs for the ecological risk assessment. Table 7 lists the radiological COCs for the human health and ecological risk assessments. All tables show the associated SNL/NM maximum background concentration values (Dinwiddie September 1997a). Tables 5 and 7 are discussed in Sections VI.4 (Human Health Risk Assessment), while Tables 6 and 7 are discussed in Sections VII.2 and VII.3 (Ecological Risk Assessment).

V. Fate and Transport

The primary releases of COCs at SWMU 4 occurred in the surface soil as a result of discharges of effluent water from the SERF in TA-V. Wind, water, and biota are natural mechanisms of COC transport from the primary release point. Because the site consists of two excavated and bermed impoundments with surrounding woody vegetation, wind is unlikely to be a significant transport mechanism for COCs at the site.

Effluent discharges to the surface impoundments (from the SERF LWDS Holding Tanks) began around 1967 and were finally discontinued in 1992. Water released to the impoundments was allowed to evaporate or infiltrate into the soil. Infiltration is expected to have carried COCs from the effluent into the subsurface soil. Phreatophytic vegetation (salt cedar trees), established around the margins of the impoundments, provides a mechanism by which subsurface water is transported back to the surface and is lost to the atmosphere through transpiration.

Water at SWMU 4 is received only as precipitation (rain or occasionally snow) that falls directly onto the site. Based upon the average rainfall measured at Albuquerque International Sunport, the site receives approximately 8.1 inches of precipitation per year (NOAA 1990). Because the site consists of excavated impoundments, all surface runoff is contained on the site. Storm-water runoff from off-site areas does not enter the site. On-site runoff will collect in the lowest parts of the impoundments where it will either infiltrate or evaporate. Water that infiltrates into

the soil can potentially leach COCs deeper into the subsurface soil as it percolates downward. Evaporation from the soil surface may result in capillary rise of soil water, reversing this downward movement and concentrating COCs at or near the surface. Because of the arid environment, evapotranspiration rates are high, with average losses of 95 to 99 percent of precipitation through this process. In addition, the phreatophytic vegetation on the site increases evapotranspiration rates at SWMU 4. Because of the low annual precipitation, high evapotranspiration rates, and depth to groundwater at this site (greater than 480 feet bgs), infiltration and percolation are not sufficient to further leach COCs into the groundwater.

COCs in the soil can enter the food chain via uptake by the plant roots. Herbivores may consume plant tissues that contain these COCs or the COCs may be returned to the soil as plant litter. Aboveground litter is capable of transport by wind until consumed by decomposer organisms in the soil. Constituents in plant tissues that are consumed by herbivores may be absorbed into tissues or may be returned to the soil (at the site or transported from the site by the herbivore). The herbivore may be eaten by a carnivore or scavenger, and the COCs in its tissues will again be either absorbed or excreted by the consumer. The potential for transport of the constituents within the food chain is dependent upon both the mobility of the species that comprise the food chain and the potential for the constituent to accumulate in tissues and be transferred across the links in the food chain. At SWMU 4, the original habitat of the site (grassland) has been highly modified by the construction of the impoundments. With the exception of the salt cedar trees that now occupy the margins of the impoundments, the current vegetative cover is low and primarily consists of ruderal species. Significant transfers of COCs in the food chain are limited by the small size of the site, the low amount of vegetation other than salt cedar trees, and the generally unpalatable nature of salt cedar to most wildlife herbivores. Therefore, food chain uptake is not considered to be a potentially significant transport mechanism at this site.

The COCs at SWMU 4 include both inorganic and organic constituents. The inorganic constituents include both radiological and nonradiological analytes. The inorganic COCs are elemental in form and generally not considered to be degradable. Radiological COCs, however, undergo decay to stable isotopes or radioactive daughter elements. Other transformations of inorganic constituents may include changes in valence (oxidation/reduction reactions) or incorporation into organic forms (e.g., the conversion of selenite or selenate from soil to seleno-amino acids in plants). The rate of such processes will be limited by the arid environment at this site. Organic COCs may be degraded through photolysis, hydrolysis, and biotransformation. Photolysis requires light and therefore takes place in the air, at the ground surface, or in surface water. Hydrolysis includes chemical transformations in water and may occur in the soil solution. Biotransformation (i.e., transformation caused by plants, animals, and microorganisms) may occur; however, biological activity may be limited by the arid environment. Some organic COCs (e.g., VOCs such as acetone, benzene, 2-butanone, and toluene) may be lost through volatilization.

Table 8 summarizes the fate and transport processes that may occur at SWMU 4. Because the site consists of excavated impoundments surrounded by salt cedar trees, the potential for COC transport via wind is low, and no surface-water runoff is expected to leave the site. COCs have leached into the subsurface soil below the impoundments; however, because of the low precipitation and high evapotranspiration rates of this area, further leaching of these COCs into the groundwater is not expected to occur. Although fenced, the site is open to use by wildlife, and some vegetation occurs at the site; therefore, uptake into the food chain is possible, but the

**Table 8
Summary of Fate and Transport at SWMU 4**

Transport and Fate Mechanism	Existence at Site	Significance
Wind	Yes	Low
Surface runoff	No	None
Migration to groundwater	No	None
Food chain uptake	Yes	Low
Transformation/degradation	Yes	Low

SWMU = Solid Waste Management Unit.

small size and relatively low vegetative cover of the site make this an insignificant transport mechanism for COCs. The potential for significant loss of COCs by degradation and/or transformation is generally low; however, some organic compounds may be lost near the soil surface through volatilization.

VI. Human Health Risk Assessment

VI.1 Introduction

The human health risk assessment of this site includes a number of steps that culminate in a quantitative evaluation of the potential adverse human health effects caused by constituents located at the site. The steps to be discussed include the following:

Step 1.	Site data are described that provide information on the potential COCs, as well as the relevant physical characteristics and properties of the site.
Step 2.	Potential pathways are identified by which a representative population might be exposed to the COCs.
Step 3.	The potential intake of these COCs by the representative population is calculated using a tiered approach. The first component of the tiered approach is a screening procedure that compares the maximum concentration of the COC to an SNL/NM maximum background screening value. COCs that are not eliminated during the first screening procedure are carried forward in the risk assessment process.
Step 4.	Toxicological parameters are identified and referenced for COCs that were not eliminated during the screening procedure.
Step 5.	Potential toxicity effects (specified as a hazard index [HI]) and estimated excess cancer risks are calculated for nonradiological COCs and background. For radiological COCs, the incremental total effective dose equivalent (TEDE) and incremental estimated cancer risk are calculated by subtracting applicable background concentrations directly from maximum on-site contaminant values. This background subtraction applies only when a radiological COC occurs as contamination and exists as a natural background radionuclide.
Step 6.	These values are compared with guidelines established by the EPA, NMED, and the U.S. Department of Energy (DOE) to determine whether further evaluation and potential site cleanup are required. Nonradiological COC risk values also are compared to background risk so that an incremental risk can be calculated.
Step 7.	Uncertainties of the above steps are addressed.

VI.2 Step 1. Site Data

Section I of this risk assessment provides the site description and history for SWMU 4. Section II presents a comparison of results to DQOs. Section III discusses the nature, rate, and extent of contamination.

VI.3 Step 2. Pathway Identification

SWMU 4 has been designated with a future land-use scenario of industrial (DOE et al. September 1995) (see Appendix 1 for default exposure pathways and parameters). However, the residential land-use scenario is also considered in the pathway analysis. Because of the location and characteristics of the potential contaminants, the primary pathway for human exposure is considered to be soil ingestion for the nonradiological COCs and direct gamma exposure for the radiological COCs. The inhalation pathway for both nonradiological and radiological COCs is included because the potential exists to inhale dust and volatiles. Soil ingestion is included for the radiological COCs as well. The dermal pathway is included for the nonradiological COCs because of the potential for the receptor to be exposed to contaminated soil. No water pathways to the groundwater are considered. Depth to groundwater at SWMU 4 is greater than 480 feet bgs. No intake routes through plant, meat, or milk ingestion are considered appropriate for either the industrial or residential land-use scenarios. Figure 3 shows the conceptual model flow diagram for SWMU 4.

Pathway Identification

Nonradiological Constituents	Radiological Constituents
Soil ingestion	Soil ingestion
Inhalation (dust and volatiles)	Inhalation (dust and volatiles)
Dermal contact	Direct gamma

VI.4 Step 3. Background Screening Procedure

This section discusses Step 3, the background screening procedure, which compares the maximum COC concentration to the background screening level. The methodology and results are described in the following sections.

VI.4.1 Methodology

Maximum concentrations of nonradiological COCs were compared to the approved SNL/NM maximum screening levels for this area. The SNL/NM maximum background concentration was selected to provide the background screen in Table 5 and used to calculate risk attributable to background in Section VI.6.2. Only the COCs that were detected above the corresponding SNL/NM maximum background screening levels or do not have either a quantifiable or calculated background screening level were considered in further risk assessment analyses.

For radiological COCs that exceeded the SNL/NM background screening levels, background values were subtracted from the individual maximum radionuclide concentrations. Those that

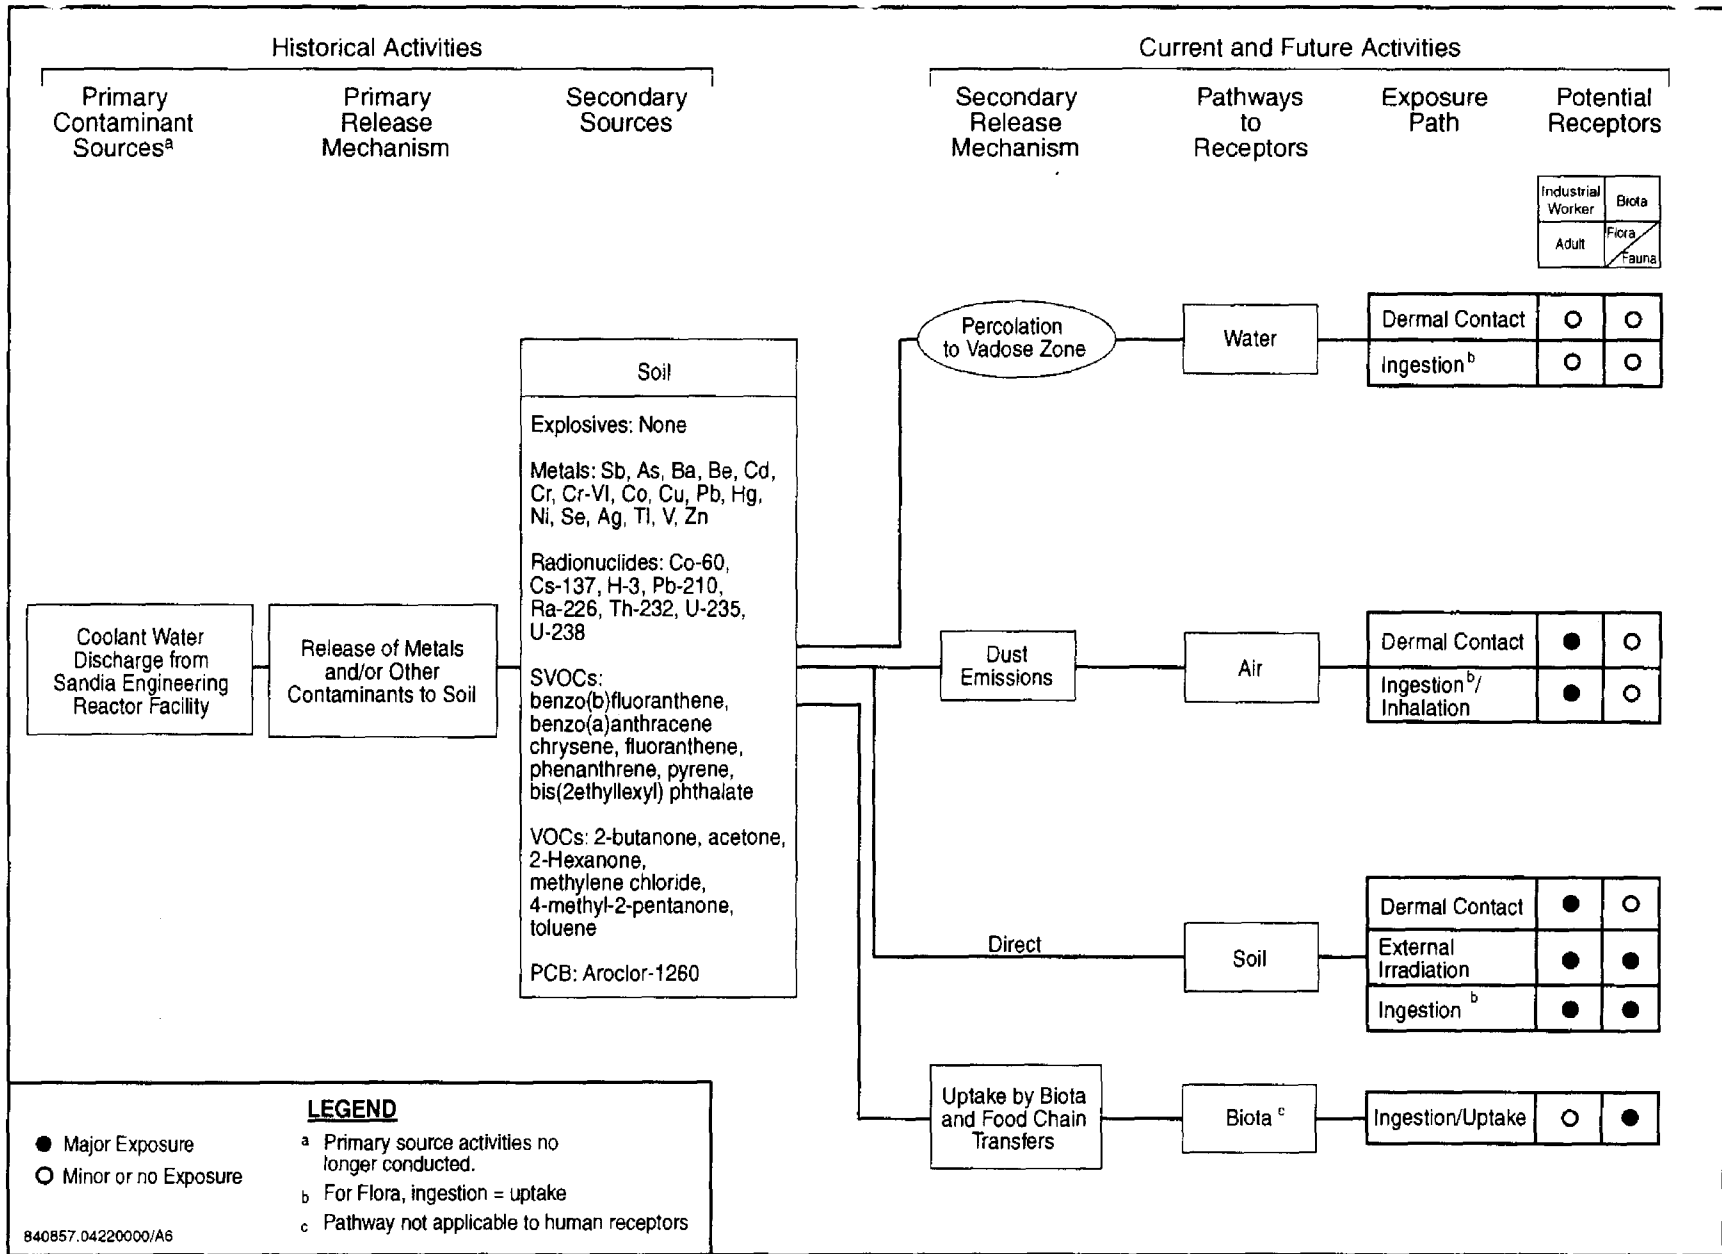

Figure 3
Conceptual Site Model Flow Diagram for SWMU 4

did not exceed these background levels were not carried any further in the risk assessment. This approach is consistent with DOE Order 5400.5, "Radiation Protection of the Public and the Environment" (DOE 1993). Radiological COCs that do not have a background value and were detected above the analytical minimum detectable activity (MDA) were carried through the risk assessment at the maximum levels. The resultant radiological COCs remaining after this step are referred to as background-adjusted radiological COCs.

VI.4.2 Results

Tables 5 and 7 present SWMU 4 maximum COC concentrations that were compared to the SNL/NM maximum background values (Dinwiddie September 1997a) for the human health risk assessment. For the nonradiological COCs, 17 constituents were measured at concentrations greater than the background values. Seventeen COCs were organic compounds that do not have corresponding calculated background concentrations.

The maximum concentration value for lead was 72.5 mg/kg. The EPA intentionally does not provide any human health toxicological data on lead; therefore, no risk parameter values could be calculated. However, the NMED guidance for lead screening concentrations for construction and industrial land-use scenarios are 750 and 1,500 mg/kg, respectively (Olson and Moats March 2000). The EPA screening guidance value for a residential land-use scenario is 400 mg/kg (Laws July 1994). The maximum concentration value for lead at this site was lower than all the screening values; therefore, lead is eliminated from further consideration in the human health risk assessment.

The maximum concentration value for total PCBs was 0.071 mg/kg. The EPA has set a screening level of 1 mg/kg for this site (Title 40, CFR, Part 761). The maximum concentration for PCBs at this site is less than the screening value; therefore, PCBs are eliminated from further consideration in the human health risk assessment.

For the radiological COCs, eight constituents (Cs-137, Co-60, H-3, Pb-210, Ra-226, Th-232, U-235, and U-238) that either exhibited MDA values greater than the corresponding background levels or did not have a corresponding background level are evaluated in this risk assessment.

VI.5 Step 4. Identification of Toxicological Parameters

Tables 9 and 10 list the COCs retained in the risk assessment and the values for the available toxicological information. The toxicological values for the nonradiological COCs presented in Table 9 were obtained from the Integrated Risk Information System (IRIS) (EPA 2003), the Health Effects Assessment Summary Tables (HEAST) (EPA 1997a), the Technical Background Document for Development of Soil Screening Levels (NMED December 2000), the EPA Region 6 (EPA 2002a), and the Risk Assessment Information System (ORNL 2003) electronic databases. Dose conversion factors (DCFs) used in determining the excess TEDE values for radiological COCs for the individual pathways were the default values provided in the RESRAD computer code (Yu et al. 1993a) as developed in the following documents:

- DCFs for ingestion and inhalation are taken from "Federal Guidance Report No. 11, Limiting Values of Radionuclide Intake and Air Concentration and Dose Conversion Factors for Inhalation, Submersion, and Ingestion" (EPA 1988a).

- DCFs for surface contamination (contamination on the surface of the site) were taken from DOE/EH-0070, "External Dose-Rate Conversion Factors for Calculation of Dose to the Public" (DOE 1988).
- DCFs for volume contamination (exposure to contamination deeper than the immediate surface of the site) were calculated using the methods discussed in "Dose-Rate Conversion Factors for External Exposure to Photon Emitters in Soil" (Kocher 1983) and in ANL/EAIS-8, "Data Collection Handbook to Support Modeling the Impacts of Radioactive Material in Soil" (Yu et al. 1993b).

VI.6 Step 5. Exposure Assessment and Risk Characterization

Section VI.6.1 describes the exposure assessment for this risk assessment. Section VI.6.2 provides the risk characterization, including the HI and excess cancer risk for both the potential nonradiological COCs and associated background for industrial and residential land-use scenarios. The incremental TEDE and incremental estimated cancer risk are provided for the background-adjusted radiological COCs for both the industrial and residential land-use scenarios.

VI.6.1 Exposure Assessment

Appendix 1 provides the equations and parameter input values used in calculating intake values and subsequent HI and excess cancer risk values for the individual exposure pathways. The appendix shows parameters for both industrial and residential land-use scenarios. The equations for nonradiological COCs are based upon the Risk Assessment Guidance for Superfund (RAGS) (EPA 1989a). Parameters are based upon information from the RAGS (EPA 1989a), the Technical Background Document for Development of Soil Screening Levels (NMED December 2000), as well as other EPA and NMED guidance documents, and reflect the reasonable maximum exposure (RME) approach advocated by the RAGS (EPA 1989a). For radiological COCs, the coded equations provided in RESRAD computer code are used to estimate the incremental TEDE and cancer risk for individual exposure pathways. Further discussion of this process is provided in the "Manual for Implementing Residual Radioactive Material Guidelines Using RESRAD" (Yu et al. 1993a).

Although the designated land-use scenario for this site is industrial, risk and TEDE values for a residential land-use scenario are also presented.

VI.6.2 Risk Characterization

Table 11 shows an HI of 0.71 for the SWMU 4 nonradiological COCs and an estimated excess cancer risk of $6E-6$ for the designated industrial land-use scenario. The numbers presented include exposure from soil ingestion, dermal contact, and dust and volatile inhalation for nonradiological COCs. Table 12 shows an HI of 0.03 and an estimated excess cancer risk of $3E-6$ assuming the maximum background concentrations of the SWMU 4 associated background constituents for the designated industrial land-use scenario.

For the radiological COCs, contribution from the direct gamma exposure pathway is included. For the industrial land-use scenario, an incremental TEDE of $1.7E+1$ millirem (mrem)/year (yr) was calculated. In accordance with EPA guidance found in Office of Solid Waste and Emergency Response (OSWER) Directive No. 9200.4-18 (EPA 1997b), an incremental TEDE of 15 mrem/yr was used for the probable land-use scenario (industrial in this case); the calculated dose value for SWMU 4 for the industrial land-use scenario is slightly above this guideline. Most of the dose is due to short-lived radionuclides that will quickly decay away. In August 2003, the DOE approved unrestricted radiological release of the site, using 25 mrem/yr as the threshold guidance (Castillo July 2003). The estimated excess cancer risk is $2.3E-4$.

For the nonradiological COCs under the residential land-use scenario, the HI is 6.58 and the excess cancer risk is $2E-5$ (Table 11). The numbers in the table include exposure from soil ingestion, dermal contact, and dust and volatile inhalation. Although the EPA (1991) generally recommends that inhalation not be included in a residential land-use scenario, this pathway was included because of the potential for soil in Albuquerque, New Mexico, to be eroded and, subsequently, for dust to be present in predominantly residential areas. Because of the nature of the local soil, other exposure pathways were not considered (see Appendix 1). Table 12 shows that for the SWMU 4 associated background constituents, the HI is 0.42 and the calculated excess cancer risk is $1E-5$.

COC = Constituent of concern.

EPA = U.S. Environmental Protection Agency.

mg/kg = Milligram(s) per kilogram.

SWMU = Solid Waste Management Unit.

– = Information not available.

For the radiological COCs, the incremental TEDE for the residential land-use scenario is 74 mrem/yr. The guideline being used is an excess TEDE of 75 mrem/yr (SNL/NM February 1998) for a complete loss of institutional controls (residential land use in this case); the calculated dose value for SWMU 4 for the residential land-use scenario is below this guideline. Consequently, SWMU 4 is eligible for unrestricted radiological release because the residential land-use scenario resulted in an incremental TEDE of less than 75 mrem/yr to the on-site receptor. The estimated excess cancer risk is 9.1E-4. The excess cancer risk from the nonradiological and radiological COCs should be summed to provide risk estimates for persons exposed to both types of carcinogenic contaminants, as noted in OSWER Directive No. 9200.4-18 (EPA 1997b). This summation is tabulated in Section VI.9, Summary.

VI.7 Step 6. Comparison of Risk Values to Numerical Guidelines

The human health risk assessment analysis evaluated the potential for adverse health effects for both the industrial (the designated land-use scenario for this site) and residential land-use scenarios.

For the nonradiological COCs under the industrial land-use scenario, the HI is 0.71 (lower than the numerical guideline of 1 suggested in the RAGS [EPA 1989a]). The estimated excess cancer risk is $6E-6$. NMED guidance states that cumulative excess lifetime cancer risk must be less than $1E-5$ (Bearzi January 2001); thus, the excess cancer risk for this site is below the suggested acceptable risk value. This assessment also determined risks considering background concentrations of the potential nonradiological COCs for both the industrial and residential land-use scenarios. Assuming the industrial land-use scenario, the associated background risk calculated for the nonradiological COCs resulted in an HI of 0.03 with an excess cancer risk of $3E-6$. The incremental risk is determined by subtracting risk associated with background from potential COC risk. These numbers are not rounded before the difference is determined and, therefore, may appear to be inconsistent with numbers presented in tables and within the text. For conservatism, the background constituents that do not have quantified background concentrations are assumed to have a hazard quotient (HQ) of 0.00. The incremental HI is 0.67 and estimated incremental cancer risk is $2.83E-6$ for the industrial land-use scenario. Both the incremental HI and excess cancer risk to human health from nonradiological COCs are below proposed guidelines considering an industrial land-use scenario.

For the radiological COCs under the industrial land-use scenario, the incremental TEDE is $1.7E+1$ mrem/yr, which is slightly higher than the EPA's numerical guideline of 15 mrem/yr but less than the DOE's guideline of 25 mrem/yr. The incremental estimated excess cancer risk is $2.3E-4$.

For the nonradiological COCs under the residential land-use scenario, the calculated HI is 6.85, which is above the numerical guidance. The estimated excess cancer risk is $2E-5$. NMED guidance states that cumulative excess lifetime cancer risk must be less than $1E-5$ (Bearzi January 2001); thus, the excess cancer risk for this site is above the suggested acceptable risk value. The HI for the associated background constituents for the residential land-use scenario is 0.42; the estimated excess cancer risk is $1E-5$. The incremental HI is 6.15 and the estimated incremental cancer risk is $1.05E-5$ for the residential land-use scenario. Both the incremental HI and excess cancer risk to human health from nonradiological COCs are above proposed guidelines considering a residential land-use scenario.

The incremental TEDE for a residential land-use scenario from the radiological components is 74 mrem/yr, which is lower than the numerical guideline of 75 mrem/yr suggested in the SNL/NM "RESRAD Input Parameter Assumptions and Justification" (SNL/NM February 1998). The estimated excess cancer risk is $9.1E-4$.

VI.8 Step 7. Uncertainty Discussion

The determination of the nature, rate, and extent of contamination at SWMU 4 was based upon an initial conceptual model that was validated with confirmatory sampling conducted across the site. The confirmatory sampling was implemented in accordance with the LWDS RFI work plan (SNL/NM March 1993). The DQOs contained in the work plan are appropriate for use in risk assessments. The data collected, based upon sample location, density, and depth, are representative of the site. The analytical requirements and results satisfy the DQOs. Data quality was verified/validated in accordance with SNL/NM procedures (SNL/NM October 1991). Therefore, there is no uncertainty associated with the quality of the data used to perform the risk assessment at SWMU 4.

Because of the location, history of the site, and future land use (DOE et al. September 1995), there is low uncertainty in the land-use scenario and the potentially affected populations that were considered in performing the risk assessment analysis. Because the COCs are found in surface and near-surface soil and because of the location and physical characteristics of the site, there is little uncertainty in the exposure pathways relevant to the analysis.

An RME approach was used to calculate the risk assessment values. This means that the parameter values in the calculations are conservative and that calculated intakes are probably overestimated. Maximum measured values of COC concentrations are used to provide conservative results.

Table 9 shows the uncertainties (confidence level) in nonradiological toxicological parameter values. There is a mixture of estimated values and values from the IRIS (EPA 2003), HEAST (EPA 1997a), Technical Background Document for Development of Soil Screening Levels (NMED December 2000), and the Risk Assessment Information System (ORNL 2003), the EPA Region 6 (EPA 2002a), and Region 9 (EPA 2002b) electronic databases. Where values are not provided, information is not available from the HEAST (EPA 1997a), IRIS (EPA 2003), Technical Background Document for Development of Soil Screening Levels (NMED December 2000), the Risk Assessment Information System (ORNL 2003) or the EPA regions (EPA 2002a, EPA 2002b, EPA 2002c). Because of the conservative nature of the RME approach, uncertainties in toxicological values are not expected to change the conclusion from the risk assessment analysis.

Risk assessment values for nonradiological COCs are within the acceptable range for human health under the industrial land-use scenario compared to established numerical guidance.

Although both the HI and estimated excess cancer risk are above the NMED guideline for the residential land-use scenario, maximum concentrations were used in the risk calculation. Because the site has been adequately characterized, average concentrations are more representative of actual site conditions. Using the upper confidence limit (UCL) of the mean concentrations for the main contributors to excess cancer risk and hazards (summarized in Appendix 2), including arsenic (2.7 mg/kg), cadmium (11.1 mg/kg), and phenanthrene (0.34 mg/kg), the total HI and estimated excess cancer risk are reduced to 2.10 and 2E-6, respectively (Table 13). Because the UCL of the mean concentration for arsenic is below background level, arsenic is eliminated from further evaluation in the risk analysis. The incremental HI and excess cancer risk are reduced to 1.89 and 2.20E-6, respectively. Thus, by using realistic concentrations in the risk calculations that more accurately depict actual site conditions, both the total and incremental estimated excess cancer risks are reduced to values below NMED guidelines. In addition, none of the individual HQs for noncarcinogens exceed 1.0 under these conditions.

For the radiological COCs, the conclusion of the risk assessment is that potential effects on human health for both the industrial and residential land-use scenarios are within guidelines and represent only a small fraction of the estimated 360 mrem/yr received by the average U.S. population (NCRP 1987).

The overall uncertainty in all of the steps in the risk assessment process is not considered to be significant with respect to the conclusion reached.

Table 13
Risk Assessment Values for SWMU 4 Nonradiological COCs with

VI.9 Summary

SWMU 4 contains identified COCs consisting of some inorganic, organic, and radiological compounds. Because of the location of the site, the designated industrial land-use scenario, and the nature of contamination, potential exposure pathways identified for this site included soil ingestion, dermal contact, and dust and volatile inhalation for chemical COCs and soil ingestion, dust inhalation, and direct gamma exposure for radionuclides. The same exposure pathways were applied to the residential land-use scenario.

Using conservative assumptions and an RME approach to risk assessment, calculations for nonradiological COCs show that for the industrial land-use scenario, the HI (0.71) is lower than the accepted numerical guidance from the EPA. The estimated excess cancer risk is $6E-6$. Thus, excess cancer risk is also below the acceptable risk value provided by the NMED for an industrial land-use scenario (Bearzi January 2001). The incremental HI is 0.67 and the incremental excess cancer risk is $2.83E-6$ for the industrial land-use scenario. The incremental risk calculations indicate insignificant risk to human health for the industrial land-use scenario.

Using conservative assumptions and an RME approach to risk assessment, calculations for nonradiological COCs show that for the residential land-use scenario, the HI (6.58) is above the accepted numerical guidance from the EPA. Estimated excess cancer risk is $2E-5$. Thus, excess cancer risk is above the acceptable risk value provided by the NMED for a residential land-use scenario (Bearzi January 2001). The incremental HI is 6.15 and the incremental excess cancer risk is $1.05E-5$ for the residential land-use scenario.

Although both the HI and estimated excess cancer risk are above the NMED guideline for the residential land-use scenario, maximum concentrations were used in the risk calculation. Because the site has been adequately characterized, average concentrations are more representative of actual site conditions. Using the UCL of the mean concentrations for the main contributors to excess cancer risk and hazards (summarized in Appendix 2), including arsenic (2.7 mg/kg), cadmium (11.1 mg/kg), and phenanthrene (0.34 mg/kg), the total HI and estimated excess cancer risk are reduced to 2.10 and $2E-6$, respectively (Table 13). Because the UCL of the mean concentration for arsenic is below the background level, arsenic is eliminated from further evaluation in the risk analysis. The incremental HI and excess cancer risk are reduced to 1.89 and $2.20E-6$, respectively. Thus, by using realistic concentrations in the risk calculations that more accurately depict actual site conditions, both the total and incremental estimated excess cancer risks are reduced to values below NMED guidelines. In addition, none of the individual HQs for noncarcinogens exceed 1.0 under these conditions.

The incremental TEDE and corresponding estimated cancer risk from radiological COCs are much lower than EPA guidance values; the estimated TEDE is $1.7E+1$ mrem/yr for the industrial land-use scenario, which is slightly above the EPA's numerical guidance of 15 mrem/yr (EPA 1997b) but less than the DOE's guideline of 25 mrem/yr. The corresponding incremental estimated cancer risk value is $2.3E-4$ for the industrial land-use scenario. Furthermore, the incremental TEDE for the residential land-use scenario that results from a complete loss of institutional control is 74 mrem/yr with an associated risk of $9.1E-4$. The guideline for this scenario is 75 mrem/yr (SNL/NM February 1998). Therefore, SWMU 4 is eligible for unrestricted radiological release.

The summation of the nonradiological and radiological incremental excess carcinogenic risks is tabulated in Table 14.

Table 14
Summation of Radiological and Nonradiological Risks from Site Carcinogens

Scenario	Nonradiological Risk	Radiological Risk	Total Risk
Industrial	2.83E-6	2.3E-4	2.3E-4
Residential	2.20E-6	9.1E-4	9.1E-4

Uncertainties associated with the calculations are considered small relative to the conservatism of the risk assessment analysis. Therefore, it is concluded that this site poses insignificant risk to human health under both the industrial and residential land-use scenarios.

VII. Ecological Risk Assessment

VII.1 Introduction

This section addresses the ecological risks associated with exposure to constituents of potential ecological concern (COPECs) in the soil at SWMU 4. A component of the NMED Risk-Based Decision Tree (NMED March 1998) is to conduct an ecological risk assessment that corresponds with that presented in EPA's Ecological RAGS (EPA 1997c). The current methodology is tiered and contains an initial scoping assessment followed by a more detailed screening assessment. Initial components of NMED's decision tree (a discussion of DQOs, data assessment, and evaluations of bioaccumulation as well as fate and transport potential) are addressed in previous sections of this report. Following the completion of the scoping assessment, a determination is made as to whether a more detailed examination of potential ecological risk is necessary. If deemed necessary, the scoping assessment proceeds to a screening assessment whereby a more quantitative estimate of ecological risk is conducted. Although this assessment incorporates conservatisms in the estimation of ecological risks, ecological relevance and professional judgment also are used as recommended by the EPA (1998) to ensure that predicted exposures of selected ecological receptors reflect those reasonably expected to occur at the site.

VII.2 Scoping Assessment

The scoping assessment focuses primarily on the likelihood of exposure of biota at, or adjacent to, the site to be exposed to constituents associated with site activities. Included in this section are an evaluation of existing data and a comparison of maximum detected concentrations to background concentrations, examination of bioaccumulation potential, and fate and transport potential. A scoping risk-management decision (Section VII.2.4) involves summarizing the scoping results and determining whether further examination of potential ecological impacts is necessary.

VII.2.1 Data Assessment

As indicated in Section IV (Tables 6 and 7), inorganic constituents in the soil within the 0- to 5-foot depth interval that exceed background concentrations are as follows:

- Antimony
- Arsenic
- Barium
- Beryllium
- Cadmium
- Chromium, total
- Chromium VI
- Cobalt
- Copper
- Lead
- Mercury
- Nickel
- Selenium
- Silver
- Thallium
- Vanadium
- Zinc
- Cs-137
- Co-60
- H-3
- Pb-210
- Ra-226
- Th-232
- U-235
- U-238

Organic analytes detected in the soil are as follows:

- Acetone
- Benzo(a)anthracene
- Benzo(b)fluoranthene
- Bis(2-ethylhexyl) phthalate
- 2-Butanone
- Chrysene
- Fluoranthene
- 2-Hexanone
- 4-Methyl-2-pentanone
- Methylene chloride
- PCBs (total)
- Phenanthrene

- Pyrene
- Toluene

VII.2.2 Bioaccumulation

Among the COPECs listed in Section VII.2.1, the following are considered to have bioaccumulation potential in aquatic environments (Section IV, Tables 6 and 7):

- Antimony
- Arsenic
- Barium
- Cadmium
- Cobalt
- Lead
- Mercury
- Nickel
- Selenium
- Thallium
- Vanadium
- Zinc
- Cs-137
- Co-60
- Pb-210
- Th-232
- U-235
- U-238
- Benzo(a)anthracene
- Benzo(b)fluoranthene
- Chrysene
- bis(2-Ethylhexyl) phthalate
- Fluoranthene
- PCBs (total)
- Phenanthrene
- Pyrene

It should be noted, however, that as directed by the NMED (March 1998), bioaccumulation for inorganic constituents is assessed exclusively based upon maximum reported bioconcentration factors (BCFs) for aquatic species. Because only aquatic BCFs are used to evaluate the bioaccumulation potential for metals, bioaccumulation in terrestrial species is likely to be overpredicted.

VII.2.3 Fate and Transport Potential

The potential for the COPECs to migrate from the source of contamination to other media or biota is discussed in Section V. As noted in Table 8 (Section V), wind is expected to be of low

significance as a transport mechanism for COPECs at this site. Because the site consists of excavated impoundments, surface-water runoff will be contained on the site, and no runoff will enter or leave the site. Migration to groundwater is not anticipated due to the arid environment and high evapotranspiration rates. Food chain uptake is expected to be of low significance. Degradation (decay) and transformation for the inorganic COPECs and radionuclides is expected to be of low significance, but volatilization may account for the loss of some organic COPECs from this site.

VII.2.4 Scoping Risk-Management Decision

Based upon information gathered through the scoping assessment, it was concluded that complete ecological pathways may be associated with SWMU 4 and that COPECs also exist at the site. As a consequence, a risk assessment was deemed necessary to predict the potential level of ecological risk associated with the site.

VII.3 Risk Assessment

As concluded in Section VII.2.4, both complete ecological pathways and COPECs are associated with this SWMU. The risk assessment performed for the site involves a quantitative estimate of current ecological risks using exposure models in association with exposure parameters and toxicity information obtained from the literature. The estimation of potential ecological risks is conservative to ensure that ecological risks are not underpredicted.

Components within the risk assessment include the following:

- Problem Formulation—sets the stage for the evaluation of potential exposure and risk.
- Exposure Estimation—provides a quantitative estimate of potential exposure.
- Ecological Effects Evaluation—presents benchmarks used to gauge the toxicity of COPECs to specific receptors.
- Risk Characterization—characterizes the ecological risk associated with exposure of the receptors to environmental media at the site.
- Uncertainty Assessment—discusses uncertainties associated with the estimation of exposure and risk.
- Risk Interpretation—evaluates ecological risk in terms of HQs and ecological significance.
- Risk Assessment Scientific/Management Decision Point—presents the decision to risk managers based upon the results of the risk assessment.

VII.3.1 Problem Formulation

Problem formulation is the initial stage of the ecological risk assessment that provides the introduction to the risk evaluation process. Components that are addressed in this section include a discussion of ecological pathways and the ecological setting, identification of COPECs, and selection of ecological receptors. The conceptual model, ecological food webs, and ecological endpoints (other components commonly addressed in a risk assessment) are presented in the "Predictive Ecological Risk Assessment Methodology, Environmental Restoration Program, Sandia National Laboratories, New Mexico" (IT July 1998) and are not duplicated here.

VII.3.1.1 *Ecological Pathways and Setting*

SWMU 4 is approximately 0.8 acre in size and is located in an area dominated by grassland habitat. The original habitat of the site is highly disturbed by the construction of the impoundments that now comprise the site. Vegetative cover is generally low over most of the site. Most of the vegetative growth consists of salt cedar trees that have become established around the margins of the impoundments. Salt cedar is generally unpalatable to wildlife herbivores. Although the site is fenced to control human access, it is generally open to use by wildlife. It does not contain perennial surface water. No threatened, endangered, or other sensitive species are known to occur within SWMU 4.

Complete ecological pathways may exist at this site through the exposure of plants and wildlife to COPECs in soil at this site. It was assumed that direct uptake of COPECs from soil is the major route of exposure for plants and that exposure of plants to wind-blown soil is minor. Exposure modeling for the wildlife receptors was limited to the food and soil ingestion pathways and external radiation. Because of the lack of surface water at this site, exposure to COPECs through the ingestion of surface water was considered insignificant. Inhalation and dermal contact were also considered insignificant pathways with respect to ingestion (Sample and Suter 1994). Groundwater is not expected to be affected by COCs at this site.

VII.3.1.2 *COPECs*

Discharges of effluent water from the SERF at TA-V are the potential sources of the COPECs associated with the soil at SWMU 4. Inorganic and organic COPECs identified for SWMU 4 are listed in Section VII.2.1. The inorganic COPECs include both radiological and nonradiological analytes. The inorganic analytes were screened against background concentrations and those that exceed the approved SNL/NM background screening levels (Dinwiddie September 1997a) for the area are considered to be COPECs. Nonradiological inorganic constituents that are essential nutrients, such as iron, magnesium, calcium, potassium, and sodium, are not included in this risk assessment as set forth by the EPA (1989a). All organic analytes detected in the upper 5 feet of the soil are considered to be COPECs for the site. In order to provide conservatism, this ecological risk assessment was based upon the maximum soil concentrations of the COPECs measured in the surface soil at this site. Tables 6 and 7 present the maximum concentrations for the COPECs.

VII.3.1.3 Ecological Receptors

A nonspecific perennial plant was selected as the receptor to represent plant species at the site (IT July 1998). Vascular plants are the principal primary producers at the site and are key to the diversity and productivity of the wildlife community associated with the site. The deer mouse (*Peromyscus maniculatus*) and the burrowing owl (*Speotyto cunicularia*) were used to represent wildlife use. Because of its opportunistic food habits, the deer mouse was used to represent a mammalian herbivore, omnivore, and insectivore. The burrowing owl was selected to represent a top predator at this site. The burrowing owl is present at SNL/NM and is designated a species of management concern by the U.S. Fish and Wildlife Service in Region 2, which includes the state of New Mexico (USFWS September 1995).

VII.3.2 Exposure Estimation

For nonradiological COPECs, direct uptake from the soil was considered the only significant route of exposure for terrestrial plants. Exposure modeling for the wildlife receptors was limited to food and soil ingestion pathways. Inhalation and dermal contact were considered insignificant pathways with respect to ingestion (Sample and Suter 1994). Drinking water was also considered an insignificant pathway because of the lack of surface water at this site. The deer mouse was modeled under three dietary regimes: as an herbivore (100 percent of its diet as plant material), as an omnivore (50 percent of its diet as plants and 50 percent as soil invertebrates), and as an insectivore (100 percent of its diet as soil invertebrates). The burrowing owl was modeled as a strict predator on small mammals (100 percent of its diet as deer mice). Because the exposure in the burrowing owl from a diet consisting of equal parts of herbivorous, omnivorous, and insectivorous mice would be equivalent to the exposure consisting of only omnivorous mice, the diet of the burrowing owl was modeled with intake of omnivorous mice only. Both species were modeled with soil ingestion comprising 2 percent of the total dietary intake. Table 15 presents the species-specific factors used in modeling exposures in the wildlife receptors. Justification for use of the factors presented in this table is described in the ecological risk assessment methodology document (IT July 1998).

Although home range is also included in this table, exposures for this risk assessment were modeled using an area use factor of 1.0, implying that all food items and soil ingested come from the site being investigated. The maximum COPEC concentrations measured in surface soil samples were used to conservatively estimate potential exposures and risks to plants and wildlife at this site.

For the radiological dose-rate calculations, the deer mouse was modeled as an herbivore (100 percent of its diet as plants), and the burrowing owl was modeled as a strict predator on small mammals (100 percent of its diet as deer mice). Both were modeled with soil ingestion comprising 2 percent of the total dietary intake. Receptors are exposed to radiation both internally and externally from Cs-137, Co-60, H-3, Pb-210, Ra-226, Th-232, U-235, and U-238. Internal and external dose rates to the deer mouse and the burrowing owl are approximated using modified dose-rate models from DOE (1995) as presented in the ecological risk assessment methodology document (IT July 1998). Radionuclide-dependent data for the dose-rate calculations were obtained from Baker and Soldat (1992). The external dose-rate model examines the total-body dose rate to a receptor residing in soil exposed to radionuclides. The soil surrounding the receptor is assumed to be an infinite medium uniformly contaminated with gamma-emitting radionuclides. The external dose-rate model is the same for both the deer

Table 15
Exposure Factors for Ecological Receptors at SWMU 4

Receptor Species	Class/Order	Trophic Level	Body Weight (kg) ^a	Food Intake Rate (kg/day) ^b	Dietary Composition ^c	Home Range (acres)
Deer Mouse (<i>Peromyscus maniculatus</i>)	Mammalia/ Rodentia	Herbivore	2.39E-2 ^d	3.72E-3	Plants: 100% (+ Soil at 2% of intake)	2.7E-1 ^e

kg = Kilogram(s).

SWMU = Solid Waste Management Unit.

mouse and the burrowing owl. The internal total-body dose-rate model assumes that a fraction of the radionuclide concentration ingested by a receptor is absorbed by the body and concentrated at the center of a spherical body shape. This provides for a conservative estimate for absorbed dose. This concentrated radiation source at the center of the body of the receptor is assumed to be a "point" source. Radiation emitted from this point source is absorbed by the body tissues to contribute to the absorbed dose. Alpha and beta emitters are assumed to transfer 100 percent of their energy to the receptor as they pass through tissues. Gamma-emitting radionuclides transfer only a fraction of their energy to the tissues because gamma rays interact less with matter than do beta or alpha emitters. The external and internal dose-rate results are summed to calculate a total dose rate from exposure to Cs-137, Co-60, H-3, Pb-210, Ra-226, Th-232, U-235, and U-238 in soil.

Table 16 provides the transfer factors used in modeling the concentrations of COPECs through the food chain. Table 17 presents maximum concentrations in soil and derived concentrations in tissues of the various food chain elements that are used to model dietary exposures for each of the wildlife receptors. Total PCBs were evaluated as Aroclor-1254.

VII.3.3 Ecological Effects Evaluation

Table 18 shows benchmark toxicity values for the plant and wildlife receptors. For plants, the benchmark soil concentrations are based upon the lowest-observed-adverse-effect level (LOAEL). For wildlife, the toxicity benchmarks are based upon the no-observed-adverse-effect level (NOAEL) for chronic oral exposure in a taxonomically similar test species. As noted above, total PCBs were evaluated as Aroclor-1254. Sufficient toxicity information was not available to estimate the LOAELs or NOAELs for some COPECs.

The benchmark used for exposure of terrestrial receptors to radiation was 0.1 rad/day. This value has been recommended by the International Atomic Energy Agency (IAEA 1992) for the protection of terrestrial populations. Because plants and insects are less sensitive to radiation than vertebrates (Whicker and Schultz 1982), the dose of 0.1 rad/day should also protect other groups within the terrestrial habitat of SWMU 4.

VII.3.4 Risk Characterization

Maximum concentrations in soil and estimated dietary exposures were compared to plant and wildlife benchmark values, respectively. Table 19 presents the results of these comparisons. HQs are used to quantify the comparison with benchmarks for plant and wildlife exposure.

The HQs for plants exceed unity for antimony, cadmium, total chromium, chromium VI, cobalt, copper, lead, mercury, nickel, selenium, silver, vanadium, and zinc. The HQs exceed unity for all three dietary regimes in the deer mouse for antimony, cadmium, and selenium, as well as for mercury when it is assumed to be entirely in organic form. In addition, the HQs exceed unity for the omnivorous and insectivorous deer mouse from exposures to arsenic, barium, thallium, vanadium, total PCBs (evaluated as Aroclor-1254), and phenanthrene, and for the insectivorous deer mouse from exposures to benzo(a)anthracene, benzo(b)fluoranthene, chrysene, and bis(2-ethylhexyl) phthalate. The HQs also exceed unity for the herbivorous and omnivorous deer mice from exposures to acetone. For the burrowing owl, the HQ exceeds unity from

Table 16
Transfer Factors Used in Exposure Models for COPECs at SWMU 4

COPEC	Soil-to-Plant Transfer Factor	Soil-to-Invertebrate Transfer Factor	Food-to-Muscle Transfer Factor

HQ = Hazard quotient.

PCB = Polychlorinated biphenyl.

SWMU = Solid Waste Management Unit.

- = Insufficient toxicity data available for risk estimation purposes.

exposure to both bis(2-ethylhexyl) phthalate and mercury when the mercury is assumed to be entirely in organic form. Because of a lack of sufficient toxicity information, HQs could not be determined for plants for 6 of the 14 organic COPECs, for the deer mouse for cobalt, and for the burrowing owl for antimony, beryllium, chromium VI, cobalt, silver, thallium, and all organic compounds except bis(2-ethylhexyl) phthalate and PCBs (evaluated as Aroclor-1254). As directed by the NMED, HIs were calculated for each of the receptors (the HI is the sum of chemical-specific HQs for all pathways for a given receptor). All receptors had total HIs greater than unity, with a maximum HI of approximately 270 for plants.

Tables 20 and 21 summarize the internal and external dose-rate model results for Cs-137, Co-60, Pb-210, Ra-226, Th-232, H-3, U-235, and U-238 for the deer mouse and burrowing owl, respectively. The total radiation dose rate to the deer mouse was predicted to be $8.2E-3$ rad/day and that for the burrowing owl was $9.1E-3$ rad/day. The dose rates for the deer mouse and the burrowing owl are lower than the benchmark of 0.1 rad/day.

VII.3.5 Uncertainty Assessment

Many uncertainties are associated with the characterization of ecological risks at SWMU 4, resulting from assumptions used in calculating risk that could overestimate or underestimate true risk presented at the site. For this risk assessment, assumptions are made that are more likely to overestimate exposures and risk rather than to underestimate them. These conservative assumptions are used to be more protective of the ecological resources potentially affected by the site. Conservatisms incorporated into this risk assessment include the use of maximum analyte concentrations measured in soil samples to evaluate risk, the use of wildlife toxicity benchmarks based upon NOAEL values, the incorporation of strict herbivorous and strict insectivorous diets for predicting the extreme HQ values for the deer mouse, and the assumption that all food and soil ingested by the wildlife receptors comes from the site. Each of these uncertainties, which are consistent among each of the SWMU-specific ecological risk assessments, is discussed in greater detail in the uncertainty section of the ecological risk assessment methodology document (IT July 1998).

Uncertainties associated with the estimation of risk to ecological receptors following exposure to Co-60, Cs-137, H-3, Pb-210, Ra-226, Th-232, U-235, and U-238 are primarily related to those inherent in the radionuclide-specific data. Radionuclide-dependent data are measured values that have their associated errors. The dose-rate models used for these calculations are based upon conservative estimates of receptor shape, radiation absorption by body tissues, and intake parameters. The goal is to provide a realistic but conservative estimate of a receptor's internal and external exposure to radionuclides in soil.

In the estimation of ecological risk, background concentrations are included as a component of maximum on-site concentrations. Conservatisms in the modeling of exposure and risk can result in the prediction of risk to ecological receptors when exposed at background concentrations. As shown in Table 22, the HQs associated with exposures to background are greater than 1.0 for antimony, arsenic, barium, total chromium, vanadium, and zinc. It is therefore likely that the actual risks from antimony, arsenic, barium, total chromium, vanadium, and zinc at SWMU 4 are overestimated by the HQs calculated in this risk assessment because of conservatisms incorporated into both the exposure assessment and toxicity benchmarks for these COPECs. In the cases of antimony, arsenic, and barium, exposure to background

HI ^b	2.0E+1	9.7E-1	4.3E+0	7.7E+0	8.3E-1

^a**Bold** values indicate the HQ or HI exceeds unity.

^bThe HI is the sum of individual HQs.

COPEC = Constituent of potential ecological concern.

HI = Hazard index.

HQ = Hazard quotient.

SWMU = Solid Waste Management Unit.

- = Insufficient toxicity data available for risk estimation purposes.

concentrations may account for more than half (63, 58, and 56 percent, respectively) of the HQ values shown in Table 19.

The assumption of an area use factor of 1.0 for all ecological receptors is a source of uncertainty for the burrowing owl. Because SWMU 4 is 0.8 acre in size, an area use factor of approximately 0.023 would be justified for the burrowing owl based upon a probable home range for this species of approximately 35 acres (see Table 15). Application of this area use factor to the HQs shown in Table 19 would reduce all of the HQs for this receptor to values less than unity (the maximum being 0.89 for exposure to bis[2-ethylhexyl] phthalate). Therefore, when more realistic assumptions of exposure to COPECs at this site are considered, the potential risks to the burrowing owl are very low.

A significant source of uncertainty associated with the prediction of ecological risk at this site is the use of the maximum measured concentrations to evaluate exposure and risk. This results in a conservative exposure scenario that does not necessarily reflect actual site conditions. To assess the potential degree of overestimation caused by using the maximum measured soil concentrations in the exposure assessment, the UCLs of the average soil concentrations were calculated (Appendix 2). For the COPECs with HQs greater than unity, these HQs can be accounted for by the magnitude of the extreme measurement. The UCLs of antimony, arsenic, barium, and vanadium (3.3, 3.1, 87, and 16.0 mg/kg, respectively) are lower than the corresponding background screening values. Therefore, risks from exposures to these COPECs at SWMU 4 are likely to be within the background levels shown in Table 22. Furthermore, all HQs for cobalt, copper, lead, and acetone are reduced to values less than unity when based upon the UCL concentrations (10, 89, 28, and 0.33 mg/kg, respectively).

In the case of cadmium, exposures to the UCL concentration (29 mg/kg) reduces the HQs for the three dietary regimes of the deer mouse to values of 1.5 or less and the HQ for plants to 9.6. For total chromium, chromium VI, nickel, silver, and zinc, the UCL concentrations (28.0, 1.9, 32.8, 19.3, and 64.1 mg/kg, respectively) reduce the HQs for plants to 28, 1.9, 1.1, 9.7, and 1.3, respectively. For total chromium, it should be noted that the plant toxicity benchmark is based upon chromium VI (Efroymson et al. 1997), which may be more toxic to plants than the more common chromium III. The data from SWMU 4 show that chromium VI accounts for less than 7 percent of total chromium (based upon the UCLs). For this reason, it is uncertain whether the calculated HQ for total chromium accurately predicts the potential risk to plants, although the plant HQ for chromium VI indicates a low potential for risk to plants from exposure to this COPEC. The plant benchmarks for cadmium, chromium, nickel, and zinc are conservatively based upon laboratory tests using soil amendments with a highly available form of these elements (Efroymson et al. 1997). It is likely that only a small fraction of the cadmium and chromium in the soil at SWMU 4 is in a form that is highly available for plant uptake. Therefore, the plant toxicity benchmarks for these metals probably overestimate risk to plants to a significant degree.

For selenium, exposures to the UCL (1.5 mg/kg) reduces the HQs for all three dietary regimes of the deer mouse to values less than unity, and the HQ for plants to 1.5, indicating a low potential for risk from this COPEC. For silver, the UCL (19.3 mg/kg) reduces the plant HQ to 9.7, indicating a low potential for risk. For thallium, exposure to the UCL concentration (0.38 mg/kg) reduces the HQ for the three dietary regimes of the deer mouse to values of 4.1 or less. In the case of mercury, the UCL (0.15 mg/kg) reduces all HQs for both plants and the deer mouse (all dietary regimes) to values less than unity regardless of whether the mercury is

assumed to be organic or inorganic in form. The HQ for the burrowing owl is reduced to 2.1 for mercury assumed to be in organic form, which is further reduced to 0.048 with the application of the area use factor of 0.023.

Use of the UCL concentration of bis(2-ethylhexyl) phthalate (0.90 mg/kg) reduces the HQ for the insectivorous deer mouse to less than unity; however, the HQ (5.8) for the burrowing owl is still above unity for this COPEC. Based upon the application of the area use factor of 0.023, however, no risk is predicted for this receptor from this COPEC.

The HQs for total PCBs exceed unity for both the omnivorous and insectivorous deer mouse when based upon the maximum detected value for PCBs. These HQs also were conservatively based upon an assumption that these PCBs were Aroclor-1254. However, at SWMU 4, only Aroclor-1260 was detected, the UCL concentration of which is 0.022 mg/kg. Based upon this UCL, and incorporating toxicity data specific to Aroclor-1260, the HQs for these two receptors (the omnivorous and insectivorous deer mouse) are reduced to 0.59 and 1.2, respectively, indicating a low potential risk from exposure to PCBs at this site.

Because only one data point is available for each of the four remaining COPECs (benzo[a]anthracene, benzo[b]fluoranthene, chrysene, and phenanthrene), evaluation of potential risk based upon the UCL is not meaningful; however, because all HQs associated with these COPECs are less than 2.3, risk is therefore considered to be low.

Based upon this uncertainty analysis, ecological risks at SWMU 4 are generally expected to be low. HQs greater than unity were initially predicted, with some HQs being significantly greater than 10; however, closer examination of the exposure assumptions revealed an overestimation of risk primarily attributed to exposure concentration and the contribution of background risk.

VII.3.6 Risk Interpretation

Ecological risks associated with SWMU 4 were estimated through a risk assessment that incorporated site-specific information when available. Overall, risks to ecological receptors are expected to be low because predicted risks associated with exposure to COPECs are based upon calculations using maximum detected values and (for the burrowing owl) the assumed area use factor of 1.0. Application of the area use factor of 0.023 reduces all HQs for the burrowing owl to values less than 1. The UCL concentrations of arsenic and barium are within the background range. HQs based upon the UCLs of cobalt, copper, lead, and acetone result in no HQs greater than unity. All other HQs (based upon UCL concentrations) are less than 10 with the exception of total chromium (HQ of 28 for plants) based upon a chromium VI plant benchmark, and all HQs greater than 2.6 are limited to plants. Based upon this final analysis, ecological risks associated with SWMU 4 are expected to be low.

VII.3.7 Risk Assessment Scientific/Management Decision Point

After potential ecological risks associated with the site have been assessed, a decision is made regarding whether the site should be recommended for NFA or whether additional data should be collected to assess actual ecological risk at the site more thoroughly. With respect to this

site, ecological risks are predicted to be low. The scientific/management decision is to recommend this site for NFA.

APPENDIX 1 EXPOSURE PATHWAY DISCUSSION FOR CHEMICAL AND RADIONUCLIDE CONTAMINATION

Introduction

Sandia National Laboratories/New Mexico (SNL/NM) uses a default set of exposure routes and associated default parameter values developed for each future land-use designation being considered for SNL/NM Environmental Restoration (ER) Project sites. This default set of exposure scenarios and parameter values are invoked for risk assessments unless site-specific information suggests other parameter values. Because many SNL/NM solid waste management units (SWMUs) have similar types of contamination and physical settings, SNL/NM believes that the risk assessment analyses at these sites can be similar. A default set of exposure scenarios and parameter values facilitates the risk assessments and subsequent review.

The default exposure routes and parameter values used are those that SNL/NM views as resulting in a Reasonable Maximum Exposure (RME) value. Subject to comments and recommendations by the U.S. Environmental Protection Agency (EPA) Region VI and New Mexico Environment Department (NMED), SNL/NM will use these default exposure routes and parameter values in future risk assessments.

At SNL/NM, all SWMUs exist within the boundaries of the Kirtland Air Force Base. Approximately 240 potential waste and release sites have been identified where hazardous, radiological, or mixed materials may have been released to the environment. Evaluation and characterization activities have occurred at all of these sites to varying degrees. Among other documents, the SNL/NM ER draft Environmental Assessment (DOE 1996) presents a summary of the hydrogeology of the sites and the biological resources present. When evaluating potential human health risk the current or reasonably foreseeable land use negotiated and approved for the specific SWMU/AOC, aggregate, or watershed will be used. The following references generally document these land uses: Workbook: Future Use Management Area 2 (DOE et al. September 1995); Workbook: Future Use Management Area 1 (DOE et al. October 1995); Workbook: Future Use Management Areas 3, 4, 5, and 6 (DOE and USAF January 1996); Workbook: Future Use Management Area 7 (DOE and USAF March 1996). At this time, all SNL/NM SWMUs have been tentatively designated for either industrial or recreational future land use. The NMED has also requested that risk calculations be performed based upon a residential land-use scenario. Therefore, all three land-use scenarios will be addressed in this document.

The SNL/NM ER Project has screened the potential exposure routes and identified default parameter values to be used for calculating potential intake and subsequent hazard index (HI), excess cancer risk and dose values. The EPA (EPA 1989) provides a summary of exposure routes that could potentially be of significance at a specific waste site. These potential exposure routes consist of:

- Ingestion of contaminated drinking water
- Ingestion of contaminated soil

- Ingestion of contaminated fish and shellfish
- Ingestion of contaminated fruits and vegetables
- Ingestion of contaminated meat, eggs, and dairy products
- Ingestion of contaminated surface water while swimming
- Dermal contact with chemicals in water
- Dermal contact with chemicals in soil
- Inhalation of airborne compounds (vapor phase or particulate)
- External exposure to penetrating radiation (immersion in contaminated air; immersion in contaminated water; and exposure from ground surfaces with photon-emitting radionuclides)

Based upon the location of the SNL/NM SWMUs and the characteristics of the surface and subsurface at the sites, we have evaluated these potential exposure routes for different land-use scenarios to determine which should be considered in risk assessment analyses (the last exposure route is pertinent to radionuclides only). At SNL/NM SWMUs, there is currently no consumption of fish, shellfish, fruits, vegetables, meat, eggs, or dairy products that originate on site. Additionally, no potential for swimming in surface water is present due to the high-desert environmental conditions. As documented in the RESRAD computer code manual (ANL 1993), risks resulting from immersion in contaminated air or water are not significant compared to risks from other radiation exposure routes.

For the industrial and recreational land-use scenarios, SNL/NM ER has, therefore, excluded the following five potential exposure routes from further risk assessment evaluations at any SNL/NM SWMU:

- Ingestion of contaminated fish and shellfish
- Ingestion of contaminated fruits and vegetables
- Ingestion of contaminated meat, eggs, and dairy products
- Ingestion of contaminated surface water while swimming
- Dermal contact with chemicals in water

That part of the exposure pathway for radionuclides related to immersion in contaminated air or water is also eliminated.

Based upon this evaluation, for future risk assessments the exposure routes that will be considered are shown in Table 1.

Table 1
Exposure Pathways Considered for Various Land-Use scenarios

Industrial	Recreational	Residential
Ingestion of contaminated drinking water	Ingestion of contaminated drinking water	Ingestion of contaminated drinking water
Ingestion of contaminated soil	Ingestion of contaminated soil	Ingestion of contaminated soil
Inhalation of airborne compounds (vapor phase or particulate)	Inhalation of airborne compounds (vapor phase or particulate)	Inhalation of airborne compounds (vapor phase or particulate)
Dermal contact (nonradiological constituents only) soil only	Dermal contact (nonradiological constituents only) soil only	Dermal contact (nonradiological constituents only) soil only
External exposure to penetrating radiation from ground surfaces	External exposure to penetrating radiation from ground surfaces	External exposure to penetrating radiation from ground surfaces

Equations and Default Parameter Values for Identified Exposure Routes

In general, SNL/NM expects that ingestion of compounds in drinking water and soil will be the more significant exposure routes for chemicals; external exposure to radiation may also be significant for radionuclides. All of the above routes will, however, be considered for their appropriate land-use scenarios. The general equation for calculating potential intakes via these routes is shown below. The equations are taken from "Assessing Human Health Risks Posed by Chemicals: Screening-Level Risk Assessment" (NMED March 2000) and "Technical Background Document for Development of Soil Screening Levels" (NMED December 2000). Equations from both documents are based upon the "Risk Assessment Guidance for Superfund" (RAGS): Volume 1 (EPA 1989, 1991). These general equations also apply to calculating potential intakes for radionuclides. A more in-depth discussion of the equations used in performing radiological pathway analyses with the RESRAD code may be found in the RESRAD Manual (ANL 1993). RESRAD is the only code designated by the U.S. Department of Energy (DOE) in DOE Order 5400.5 for the evaluation of radioactively contaminated sites (DOE 1993). The Nuclear Regulatory Commission (NRC) has approved the use of RESRAD for dose evaluation by licensees involved in decommissioning, NRC staff evaluation of waste disposal requests, and dose evaluation of sites being reviewed by NRC staff. EPA Science Advisory Board reviewed the RESRAD model. EPA used RESRAD in their rulemaking on radiation site cleanup regulations. RESRAD code has been verified, undergone several benchmarking analyses, and been included in the International Atomic Energy Agency's VAMP and BIOMOVs II projects to compare environmental transport models.

Also shown are the default values SNL/NM ER will use in RME risk assessment calculations for industrial, recreational, and residential land-use scenarios, based upon EPA and other governmental agency guidance. The pathways and values for chemical contaminants are discussed first, followed by those for radionuclide contaminants. RESRAD input parameters that are left as the default values provided with the code are not discussed. Further information relating to these parameters may be found in the RESRAD Manual (ANL 1993) or by directly accessing the RESRAD websites at: <http://web.ead.anl.gov/resrad/home2/> or <http://web.ead.anl.gov/resrad/documents/>.

Generic Equation for Calculation of Risk Parameter Values

The equation used to calculate the risk parameter values (i.e., hazard quotients/HI, excess cancer risk, or radiation total effective dose equivalent [TEDE] [dose]) is similar for all exposure pathways and is given by:

$$\text{Risk (or Dose)} = \text{Intake} \times \text{Toxicity Effect (either carcinogenic, noncarcinogenic, or radiological)}$$

$$= C \times (\text{CR} \times \text{EFD}/\text{BW}/\text{AT}) \times \text{Toxicity Effect} \tag{1}$$

where;

- C = contaminant concentration (site specific)
- CR = contact rate for the exposure pathway
- EFD= exposure frequency and duration
- BW = body weight of average exposure individual
- AT = time over which exposure is averaged.

For nonradiological constituents of concern (COCs), the total risk/dose (either cancer risk or HI) is the sum of the risks/doses for all of the site-specific exposure pathways and contaminants. For radionuclides, the calculated radiation exposure, expressed as TEDE is compared directly to the exposure guidelines of 15 millirem per year (mrem/year) for industrial and recreational future use and 75 mrem/year for the unlikely event that institutional control of the site is lost and the site is used for residential purposes (EPA 1997).

The evaluation of the carcinogenic health hazard produces a quantitative estimate for excess cancer risk resulting from the COCs present at the site. This estimate is evaluated for determination of further action by comparison of the quantitative estimate with the potentially acceptable risk of 1E-5 for nonradiological carcinogens. The evaluation of the noncarcinogenic health hazard produces a quantitative estimate (i.e., the HI) for the toxicity resulting from the COCs present at the site. This estimate is evaluated for determination of further action by comparison of this quantitative estimate with the EPA standard HI of unity (1). The evaluation of the health hazard from radioactive compounds produces a quantitative estimate of doses resulting from the COCs present at the site. This estimated dose is used to calculate an assumed risk. However, this calculated risk is presented for illustration purposes only, not to determine compliance with regulations.

The specific equations used for the individual exposure pathways can be found in RAGS (EPA 1989) and are outlined below. The RESRAD Manual (ANL 1993) describes similar equations for the calculation of radiological exposures.

Soil Ingestion

A receptor can ingest soil or dust directly by working in the contaminated soil. Indirect ingestion can occur from sources such as unwashed hands introducing contaminated soil to food that is then eaten. An estimate of intake from ingesting soil will be calculated as follows:

$$I_s = \frac{C_s * IR * CF * EF * ED}{BW * AT}$$

where:

- I_s = Intake of contaminant from soil ingestion (milligrams [mg]/kilogram [kg]-day)
- C_s = Chemical concentration in soil (mg/kg)
- IR = Ingestion rate (mg soil/day)
- CF = Conversion factor (1E-6 kg/mg)
- EF = Exposure frequency (days/year)
- ED = Exposure duration (years)
- BW = Body weight (kg)
- AT = Averaging time (period over which exposure is averaged) (days)

It should be noted that it is conservatively assumed that the receptor only ingests soil from the contaminated source.

Soil Inhalation

A receptor can inhale soil or dust directly by working in the contaminated soil. An estimate of intake from inhaling soil will be calculated as follows (EPA August 1997):

$$I_s = \frac{C_s * IR * EF * ED * \left(\frac{1}{VF} \text{ or } \frac{1}{PEF} \right)}{BW * AT}$$

where:

- I_s = Intake of contaminant from soil inhalation (mg/kg-day)
- C_s = Chemical concentration in soil (mg/kg)
- IR = Inhalation rate (cubic meters [m³]/day)
- EF = Exposure frequency (days/year)
- ED = Exposure duration (years)
- VF = soil-to-air volatilization factor (m³/kg)
- PEF = particulate emission factor (m³/kg)
- BW = Body weight (kg)
- AT = Averaging time (period over which exposure is averaged) (days)

Soil Dermal Contact

$$D_a = \frac{C_s * CF * SA * AF * ABS * EF * ED}{BW * AT}$$

where:

- D_a = Absorbed dose (mg/kg-day)
- C_s = Chemical concentration in soil (mg/kg)
- CF = Conversion factor (1E-6 kg/mg)
- SA = Skin surface area available for contact (cm²/event)
- AF = Soil to skin adherence factor (mg/cm²)
- ABS = Absorption factor (unitless)
- EF = Exposure frequency (events/year)

ED = Exposure duration (years)
 BW = Body weight (kg)
 AT = Averaging time (period over which exposure is averaged) (days)

Groundwater Ingestion

A receptor can ingest water by drinking it or through using household water for cooking. An estimate of intake from ingesting water will be calculated as follows (EPA August 1997):

$$I_w = \frac{C_w * IR * EF * ED}{BW * AT}$$

where:

I_w = Intake of contaminant from water ingestion (mg/kg/day)
 C_w = Chemical concentration in water (mg/liter [L])
 IR = Ingestion rate (L/day)
 EF = Exposure frequency (days/year)
 ED = Exposure duration (years)
 BW = Body weight (kg)
 AT = Averaging time (period over which exposure is averaged) (days)

Groundwater Inhalation

The amount of a constituent taken into the body via exposure to volatilization from showering or other household water uses will be evaluated using the concentration of the constituent in the water source (EPA 1991 and 1992). An estimate of intake from volatile inhalation from groundwater will be calculated as follows (EPA 1991):

$$I_w = \frac{C_w * K * IR_i * EF * ED}{BW * AT}$$

where:

I_w = Intake of volatile in water from inhalation (mg/kg/day)
 C_w = Chemical concentration in water (mg/L)
 K = volatilization factor (0.5 L/m³)
 IR_i = Inhalation rate (m³/day)
 EF = Exposure frequency (days/year)
 ED = Exposure duration (years)
 BW = Body weight (kg)
 AT = Averaging time (period over which exposure is averaged—days)

For volatile compounds, volatilization from groundwater can be an important exposure pathway from showering and other household uses of groundwater. This exposure pathway will only be evaluated for organic chemicals with a Henry's Law constant greater than 1×10^{-5} and with a molecular weight of 200 grams/mole or less (EPA 1991).

Tables 2 and 3 show the default parameter values suggested for use by SNL/NM at SWMUs, based upon the selected land-use scenarios for nonradiological and radiological COCs,

respectively. References are given at the end of the table indicating the source for the chosen parameter values. SNL/NM uses default values that are consistent with both regulatory guidance and the RME approach. Therefore, the values chosen will, in general, provide a conservative estimate of the actual risk parameter. These parameter values are suggested for use for the various exposure pathways, based upon the assumption that a particular site has no unusual characteristics that contradict the default assumptions. For sites for which the assumptions are not valid, the parameter values will be modified and documented.

Summary

SNL/NM will use the described default exposure routes and parameter values in risk assessments at sites that have an industrial, recreational, or residential future land-use scenario. There are no current residential land-use designations at SNL/NM ER sites, but NMED has requested this scenario to be considered to provide perspective of the risk under the more restrictive land-use scenario. For sites designated as industrial or recreational land use, SNL/NM will provide risk parameter values based upon a residential land-use scenario to indicate the effects of data uncertainty on risk value calculations or in order to potentially mitigate the need for institutional controls or restrictions on SNL/NM ER sites. The parameter values are based upon EPA guidance and supplemented by information from other government sources. If these exposure routes and parameters are acceptable, SNL/NM will use them in risk assessments for all sites where the assumptions are consistent with site-specific conditions. All deviations will be documented.

Table 2
Default Nonradiological Exposure Parameter Values for Various Land-Use scenarios

Parameter	Industrial	Recreational	Residential
General Exposure Parameters			
Exposure Frequency (day/yr)	250 ^{a,b}	8.7 (4 hr/wk for 52 wk/yr) ^{a,b}	350 ^{a,b}
Exposure Duration (yr)	25 ^{a,b,c}	30 ^{a,b,c}	30 ^{a,b,c}
Body Weight (kg)	70 ^{a,b,c}	70 Adult ^{a,b,c} 15 Child ^{a,b,c}	70 Adult ^{a,b,c} 15 Child ^{a,b,c}
Averaging Time (days) for Carcinogenic Compounds (= 70 yr x 365 day/yr)	25,550 ^{a,b}	25,550 ^{a,b}	25,550 ^{a,b}
for Noncarcinogenic Compounds (= ED x 365 day/yr)	9,125 ^{a,b}	10,950 ^{a,b}	10,950 ^{a,b}
Soil Ingestion Pathway			
Ingestion Rate (mg/day)	100 ^{a,b}	200 Child ^{a,b} 100 Adult ^{a,b}	200 Child ^{a,b} 100 Adult ^{a,b}
Inhalation Pathway			
Inhalation Rate (m ³ /day)	20 ^{a,b}	15 Child ^a 30 Adult ^a	10 Child ^a 20 Adult ^a
Volatilization Factor (m ³ /kg)	Chemical Specific	Chemical Specific	Chemical Specific
Particulate Emission Factor (m ³ /kg)	1.36E9 ^a	1.36E9 ^a	1.36E9 ^a
Water Ingestion Pathway			
Ingestion Rate (liter/day)	2.4 ^a	2.4 ^a	2.4 ^a
Dermal Pathway			
Skin Adherence Factor (mg/cm ²)	0.2 ^a	0.2 Child ^a 0.07 Adult ^a	0.2 Child ^a 0.07 Adult ^a
Exposed Surface Area for Soil/Dust (cm ² /day)	3,300 ^a	2,800 Child ^a 5,700 Adult ^a	2,800 Child ^a 5,700 Adult ^a
Skin Adsorption Factor	Chemical Specific	Chemical Specific	Chemical Specific

**APPENDIX 2
CALCULATION OF THE UPPER CONFIDENCE LIMITS OF
MEAN CONCENTRATIONS**

For conservatism, Sandia National Laboratories/New Mexico uses the maximum concentration of the constituents of concern (COCs) for initial risk calculation. If the maximum concentrations produce risk above New Mexico Environment Department (NMED) guidelines, conservatism with this approach is evaluated and, if appropriate, a more realistic approach is applied. When the site has been adequately characterized, an estimate of the mean concentration of the COCs is more representative of actual site conditions. The NMED has proposed the use of the upper confidence limit (UCL) of the mean to represent average concentrations at a site (NMED December 2000). The UCL is calculated according to NMED guidance (Tharp June 2002) using the U.S. Environmental Protection Agency ProUCL program (EPA April 2002). Attached are the outputs from that program and the calculated UCLs used in the risk analysis.

CERTIFIED MAIL – RETURN RECEIPT REQUESTED

Mr. James Bearzi, Chief
Hazardous Waste Bureau
New Mexico Environment Department
2905 Rodeo Park Road East, Building 1
Santa Fe, NM 87505

Dear Mr. Bearzi:

On behalf of the Department of Energy (DOE) and Sandia Corporation, DOE is submitting the enclosed responses to NMED's Request for Supplemental Information for SWMU 4, the Liquid Waste Disposal System Surface Impoundments, that was included as part of the letter dated November 2, 2005 referenced as Notice of Approval: SWMUs 52, 233, and 234, Notice of Disapproval: SWMUs 4 and 5, Environmental Restoration Project Supplemental Risk Document, June 2005 Sandia National Laboratories, New Mexico, EPA ID No. NM589011518, HWB-SNL-99-006 and 99-020.

If you have any questions, please contact me at (505) 845-6036, or John Gould at (505) 845-6089.

Sincerely,

Patty Wagner
Manager

Sandia National Laboratories Albuquerque, New Mexico January 2006

Environmental Restoration Project Responses to NMED Request for Supplemental Information for Solid Waste Management Unit 4, Liquid Waste Disposal System Surface Impoundments Dated November 2005

INTRODUCTION

This document responds to the November 2, 2005 “Notice of Disapproval for SWMU [Solid Waste Management Unit] 4 (LWDS [Liquid Waste Disposal System] Surface Impoundments)” requesting additional information. The notice was from James P. Bearzi of the State of New Mexico Environment Department (NMED) Hazardous Waste Bureau to the U.S. Department of Energy and Sandia National Laboratories/New Mexico (SNL/NM). This response, considered to be a response to a Request for Supplemental Information, was due within sixty (60) days of receipt of the letter by SNL/NM, or by January 6, 2006.

In this document, the NMED comments (in bold font) are restated in the same order in which they were provided in the notice. Following each comment, the word “Response” introduces the U.S. Department of Energy/SNL/NM reply (in normal font style).

- 1. Submit all surface and subsurface soil data collected from the investigations at SWMU 4 in the form of tables using the currently accepted format.**

Response: Data tables in the currently acceptable format are provided in Attachment A. These tables provide the data that was used as the basis for the risk assessment, which concluded that this site poses insignificant risk to human health under both the industrial and residential land-use scenarios.

- 2. Provide a map of SWMU 4 that shows the locations of the surface impoundments, soil sample collection points, boreholes, and monitoring wells.**

Response: Attachment B includes two figures. Figure B-1 is a Technical Area III and V (TA-III/V) location map showing the LWDS SWMUs (4, 5, and 52), and the 13 wells

that comprise the TA-III/V monitoring well network. Figure B-2 is a map of SWMU 4 that includes the land-surface elevation contours of the surface impoundments, the 1992 soil-sampling grid and sample locations, the boreholes and monitoring wells that are in the immediate vicinity of, and most directly associated with SWMU 4.

3. Discuss the fate of the resin beads that were encountered in the soil beneath the drainline outfall from Impoundment 1 at SWMU 4.

Response: The location of the resin beads is shown in Attachment B on Figure B-2; the location is identified in the legend as “Hot Spot (HS) Soil Sample at Drain Outfall.” There are two sections in the 1995 Resource Conservation and Recovery Act (RCRA) Field Investigation Report that deal with the resin beads. As indicated on Page 4-26 of the report, “. . . resin beads were dispersed in the soil directly beneath the surface of the Impoundment 1 drainline outfall. These resin beads probably resulted from backflushing of the ion-exchange resin beds, the major discharge activity of the SERF [Sandia Engineering Reactor Facility].” And as indicated on Page 4-38, “The highest levels of [radioactive] contamination were directly under the Impoundment 1 drainline outfall . . .”

The resin beads still remain in the soil at the site. As shown in the June 2005 risk assessment, the radionuclide activity associated with the resin beads when left in place was determined to provide an acceptable dose level for unrestricted release. Thus no action was taken to remove the resin beads.

4. Clarify whether the impoundments at SWMU 4 will be backfilled to grade with native soil, as was stated in the Summary and Conclusions section of the 1995 RCRA Field Investigation Report for the Liquid Waste Disposal System.

Response: It has been determined that the site does not constitute a safety hazard. The decision not to backfill the site was discussed with NMED personnel in January 2003 but not formally documented. On 12/16/2005, SWMU 4 was inspected by SNL/NM Safety Engineering personnel from Department 10322 to verify the prior determination and to document the results. This inspection confirmed that SWMU 4 meets New Mexico and Federal Occupational Safety and Health Administration excavation requirements, including the following from Subpart P – Excavations:

1. The site is fenced/barricaded from access - 29CFR1926.651(f)
2. The site is posted/signed - 29CFR1926.651(f)
3. The site is not directly exposed to vehicle traffic - 29CFR1926.651(d)
4. The excavation slopes are 1.5 to 1 (34 degrees from the horizontal) - 29CFR1926.652(b)(1)

Therefore, the SNL/NM ER Project does not plan to backfill the site.

Table A-1 (Continued)
Summary of SWMU 4 Soil Sampling, VOC Analytical Results
July 1992–December 1994
(Off-Site Laboratory)

Note: Values in **bold** represent detected analytes.

^aEPA November 1986.

^bAnalysis request/chain-of-custody record.

^cSamples were analyzed using EPA Method 8010, 8020, and 8240. The higher reporting limits are associated with Methods 8010 and 8020.

^dSoil sample collected at drain outfall in Impoundment 2; this sample was located in Grid 35 on maps but included with samples collected in Grid 36.

(D) = Duplicate sample.

(EB) = Equipment blank (added as identifier to ER Sample ID).

EPA = U.S. Environmental Protection Agency.

ER = Environmental Restoration.

ft = Foot (feet).

ID = Identification.

J () = Estimated value is less than laboratory reporting limit, shown in parentheses.

µg/kg = Microgram(s) per kilogram.

µg/L = Microgram(s) per liter.

NA = Not applicable.

ND () = Analyte not detected above the RL, shown in parentheses.

NR = Not reported.

RL = Reporting limit.

SWMU = Solid Waste Management Unit.

(TB) = Trip blank (added as identifier to ER Sample ID).

VOC = Volatile organic compound.

Table A-2
 Summary of SWMU 4 Soil Sampling VOC Analytical RLs
 July 1992–December 1994
 (Off-Site Laboratory)

Analyte	Reporting Limit ($\mu\text{g}/\text{kg}$)
Acetone	10–1000
Benzene	5–50
Bromodichloromethane	5–100
Bromoform	5–500
Bromomethane	10–500
2-Butanone	10–20
Carbon disulfide	5–10
Carbon tetrachloride	5–50
Chlorobenzene	5–200
Chloroethane	10–500
Chloroform	5–50
Chloromethane	10–500
Dibromochloromethane	5–100
1,2-Dibromoethane	200
1,2-Dichlorobenzene	50
1,3-Dichlorobenzene	50
1,4-Dichlorobenzene	50
1,1-Dichloroethane	5–50
1,2-Dichloroethane	5–100
1,1-Dichloroethene	5–50
1,2-Dichloroethene	5–10
trans-1,2-Dichloroethene	50
1,2-Dichloropropane	5–100
cis-1,3-Dichloropropene	5–200
trans-1,3-Dichloropropene	5–100
Ethyl benzene	5–50
2-Hexanone	10–20
Methylene chloride	5–500
4-Methyl-2-pentanone	10–20
Styrene	5–10
1,1,2,2-Tetrachloroethane	5–100
Tetrachloroethene	5–50
Toluene	5–50
1,1,1-Trichloroethane	5–50
1,1,2-Trichloroethane	5–100
Trichloroethene	5–50
2,2-Trifluoroethane, 1,1,2-trichloro-1	100
Vinyl acetate	10–20
Vinyl chloride	10–100
Xylene	5–50

$\mu\text{g}/\text{kg}$ = Microgram(s) per kilogram.
 RL = Reporting limit.
 SWMU = Solid Waste Management Unit.
 VOC = Volatile organic compound.

Note: Values in **bold** represent detected analytes.

^aEPA November 1986.

^bAnalysis request/chain-of-custody record.

^cSoil sample collected at drain outfall in Impoundment 2; this sample was located in Grid 35 on maps but included with samples collected in Grid 36.

(EB) = Equipment Blank (added as identifier to ER Sample ID).

(D) = Duplicate sample.

EPA = U.S. Environmental Protection Agency.

ER = Environmental Restoration.

ft = Foot (feet).

ID = Identification.

J () = Estimated value is less than laboratory reporting limit, shown in parentheses.

µg/kg = Microgram(s) per kilogram.

µg/L = Microgram(s) per liter.

NA = Not applicable.

ND () = Analyte not detected above the RL, shown in parentheses.

RL = Reporting limit.

SVOC = Semivolatile organic compound.

SWMU = Solid Waste Management Unit.

Table A-4
 Summary of SWMU 4 Soil Sampling SVOC Analytical RLS
 July 1992–December 1994
 (Off-Site Laboratory)

Analyte	Reporting Limit (µg/kg)
Acenaphthene	330–6,600
Acenaphthylene	330–6,600
Anthracene	330–6,600
Benzo(a)anthracene	330–6,600
Benzo(a)pyrene	330–6,600
Benzo(b)fluoranthene	330–6,600
Benzo(g,h,i)perylene	330–6,600
Benzo(k)fluoranthene	330–6,600
Benzoic acid	1,600–32,000
Benzyl alcohol	330–6,600
4-Bromophenyl phenyl ether	330–6,600
Butylbenzyl phthalate	330–6,600
Carbazole	330–1,600
4-Chlorobenzenamine	330–6,600
bis(2-Chloroethoxy)methane	330–6,600
bis(2-Chloroethyl)ether	330–6,600
bis-Chloroisopropyl ether	330–6,600
4-Chloro-3-methylphenol	330–6,600
2-Chloronaphthalene	330–6,600
2-Chlorophenol	330–6,600
4-Chlorophenyl phenyl ether	330–6,600
Chrysene	330–6,600
o-Cresol	330–6,600
p-Cresol	330–6,600
Di-n-butyl phthalate	330–6,600
Di-n-octyl phthalate	330–6,600
Dibenz[a,h]anthracene	330–6,600
Dibenzofuran	330–6,600
1,2-Dichlorobenzene	330–6,600
1,3-Dichlorobenzene	330–6,600
1,4-Dichlorobenzene	330–6,600
3,3'-Dichlorobenzidine	660–13,000
2,4-Dichlorophenol	330–6,600
Diethylphthalate	330–6,600
2,4-Dimethylphenol	330–6,600
Dimethylphthalate	330–6,600
Dinitro-o-cresol	1,600–32,000
2,4-Dinitrophenol	1,600–32,000
2,4-Dinitrotoluene	330–6,600
2,6-Dinitrotoluene	330–6,600
bis(2-Ethylhexyl) phthalate	330–6,600
Fluoranthene	330–6,600
Fluorene	330–6,600
Hexachlorobenzene	330–6,600
Hexachlorobutadiene	330–6,600

Refer to footnotes at end of table.

Note: Values in **bold** exceed background concentration.

^aEPA November 1986.

^bAnalysis request/chain-of-custody record.

^cDinwiddie September 1997, Southwest Area Supergroup.

^dSoil sample collected at drain outfall in Impoundment 2; this sample was located in Grid 35 on maps but included with samples collected in Grid 36.

^eSample measured by both Method 6010 (5.7 mg/kg) and Method 7421 (6.9 mg/kg).

- (D) = Duplicate sample.
- (EB) = Equipment Blank (added as identifier to ER Sample ID).
- EPA = U.S. Environmental Protection Agency.
- ER = Environmental Restoration.
- ft = Foot (feet).
- ID = Identification.
- J () = Estimated value is less than laboratory reporting limit, shown in parentheses.
- mg/kg = Milligram(s) per kilogram.
- mg/L = Milligram(s) per liter.
- NA = Not applicable.
- ND () = Analyte not detected above the RL, shown in parentheses.
- ND ()** = Not detected, but the RL (shown in parentheses) exceeds background concentration.
- NR = Not reported.
- RL = Reporting limit.
- SWMU = Solid Waste Management Unit.

Table A-8
 Summary of SWMU 4 Soil Sampling Metals Analytical RLs
 July 1992–December 1994
 (Off-Site Laboratory)

Analyte	Reporting Limit (mg/kg)
Antimony	6–12
Arsenic	0.3–4
Barium	1–2
Beryllium	0.1–0.4
Cadmium	0.5–1
Chromium	1–2
Chromium (VI)	0.1–10
Cobalt	1–2
Copper	0.7–4
Lead	0.3–5
Mercury	0.1
Nickel	0.9–8
Selenium	0.5–20
Silver	1–2
Thallium	0.5–5
Vanadium	1–2
Zinc	2–4

mg/kg = Milligram(s) per kilogram.
 RL = Reporting limit.
 SWMU = Solid Waste Management Unit.

4164	LWDS-SS-HS	0	NR	--	1.5	0.2	NR	--
Background Activity ^c			1.01	--	0.16	--	1.4	--

Note: Values in **bold** exceed background soil activities for all radionuclides except cobalt-60. Cobalt-60 is not naturally occurring therefore **bold** values indicate detections.

^aAnalysis request/chain-of-custody record.

^bTwo standard deviations about the mean detected activity.

^cDinwiddie September 1997, Southwest Area Supergroup.

^dSoil sample collected at drain outfall in Impoundment 2; this sample was located in Grid 35 on maps but included with samples collected in Grid 36.

ER = Environmental Restoration.

ft = Foot (feet).

ID = Identification.

NA = Not applicable.

ND () = Not detected above the reporting limit, shown in parentheses.

NR = Not reported.

pCi/g = Picocurie(s) per gram.

-- = Not applicable.

Table A-10 (Concluded)
 Summary of SWMU 4 Soil Sampling
 Tritium Analytical Results
 July 1992–December 1994
 (On-Site and Off-Site Laboratories)

Sample Attributes			Activity (pCi/g)		Activity (pCi/L)	
Record Number ^a	ER Sample ID	Sample Depth (ft)	Result	Error ^b	Result	Error ^b
4163	LWDS-SS-47	0	0.2	0.3	NR	--
04038	LWDS-SS-48	0	-0.1	0.3	NR	--
4164	LWDS-SS-HS	0	0	0.3	NR	--
4162	LWDS-SS-HS	1	0.2	0.3	NR	--
Background Activity ^c			0.021	NA	420	NA

Note: Values in bold exceed background soil activity.

^aAnalysis request/chain-of-custody record.

^bTwo standard deviations about the mean detected activity.

^cDinwiddie September 1997, Southwest Area Supergroup.

^dSoil sample collected at drain outfall in Impoundment 2; this sample was located in Grid 35 on maps but included with samples collected in Grid 36.

ER = Environmental Restoration.

ft = Foot (feet).

ID = Identification.

NA = Not applicable.

ND () = Analyte not detected above the RL, shown in parentheses.

NR = Not reported.

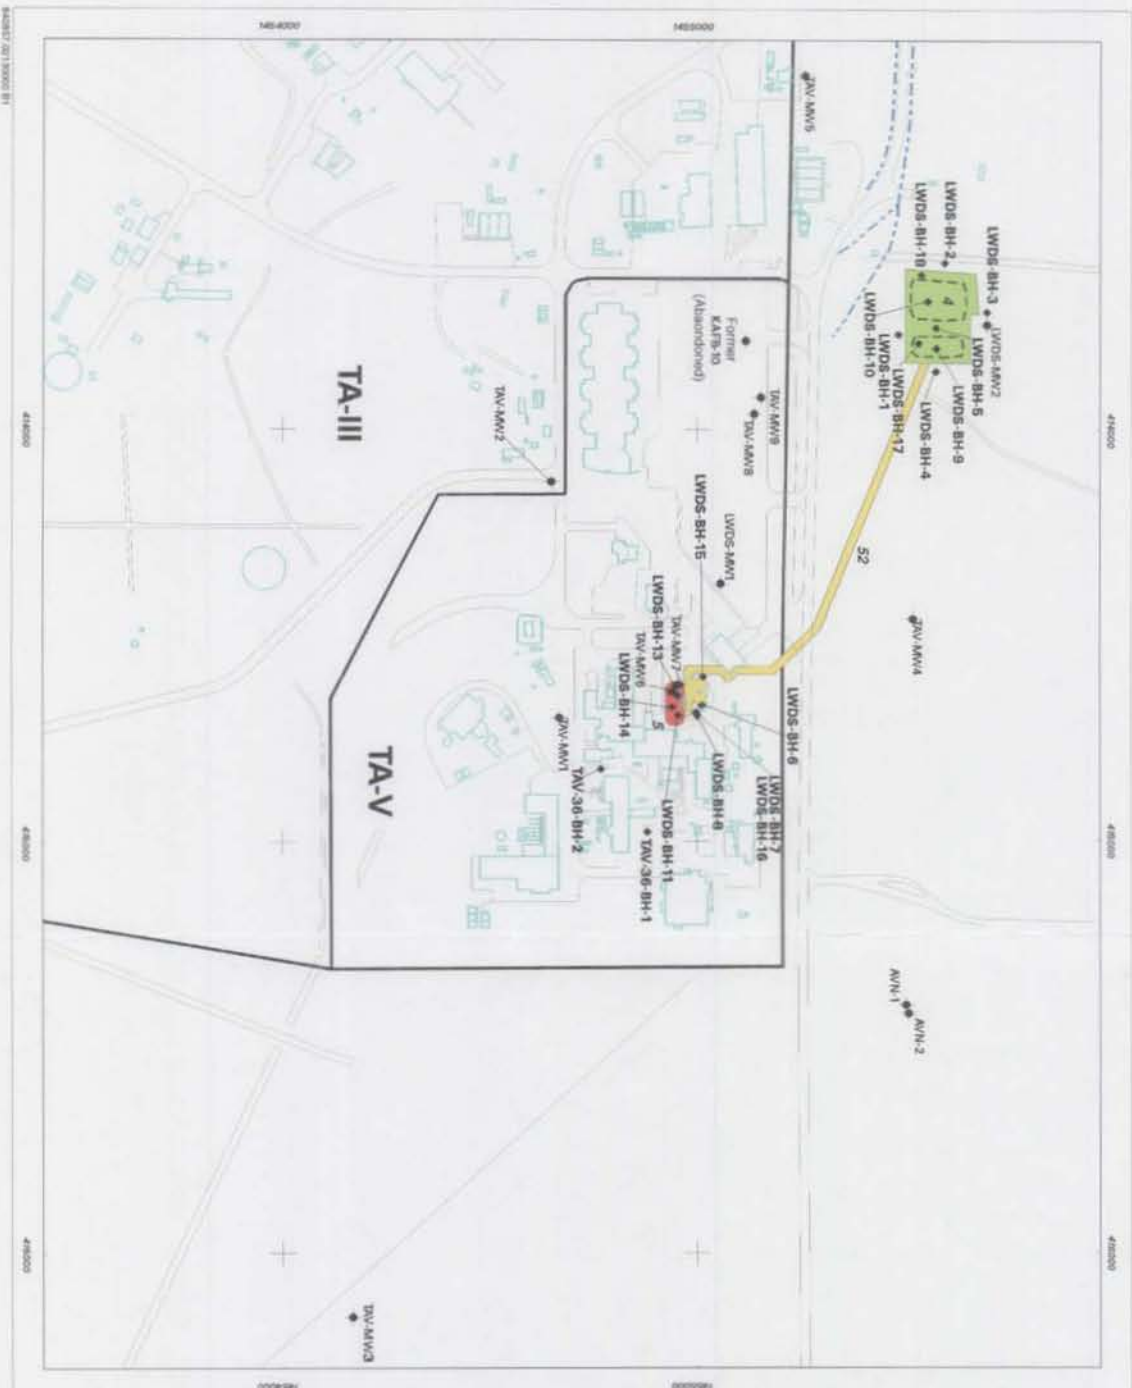

pCi/g = Picocurie(s) per gram.

pCi/L = Picocurie(s) per liter.

SWMU = Solid Waste Management Unit.

-- = Error not calculated for nondetected values.
