Arizona Red, Flagstaff's Sandstone Industry

by Pat H. Stein

In 1892 the eyes of Albuquerque focused on the new building at the southwest corner of Gold Avenue and Fourth Street, for the activities to be conducted in it would shape the city's future. The building would house the Commercial Club (Fig. 1) (forerunner of the Chamber of Commerce,) a booster organization founded to attract and hold residents and capital investment. Replete with sumptuous meeting rooms, a dance hall, parlors, and business offices, the edifice was designed to host events to "boom the town." Through the turn of the century the Commercial Club would sponsor social events, business functions, and publications to promote the climate, cultural assets, and business potential of the city. The Commercial Club Building soon became a focal point for the community by virtue of its very architecture. Composed of a vibrant red sandstone, the building seemed to glow with its own light. The booster association could not have chosen a better medium to symbolize the energy, prosperity, and drive of this frontier city.

The construction material was sandstone from Flagstaff, Arizona Territory. The sandstone industry rose from the ashes of a series of fires that plagued Flagstaff in the 1880s. Located in the largest continuous stand of pine in the world, Flagstaff had a cheap and abundant source of lumber. But, as fires in 1884, 1886, and 1888 leveled block by block of frame structures, Flagstaff residents chose materials other than wood in rebuilding their homes and businesses. Brick became a popular alternative, and was shipped in and manufactured locally.

But there was another material, one that was as durable and attractive as brick, and that could be found literally at the town's doorstep. That material was Moenkopi sandstone, also called Arizona Red or Flagstaff Red sandstone. Known to local builders from the early 1880s, Moenkopi sandstone was first used for foundations rather than entire buildings. By the late 1880s, however, the flame-resistant material formed the main fabric of Flagstaff's new hotel, general store, and train depot.

The source of the sandstone was a high-grade deposit one mile east of town. In the mid 1880s an entrepreneur named Charles Begg became interested in the deposit and began to develop a quarry there (Fig. 2). In 1887 Begg patented the quarry and the 160 acre parcel in which it lay. He immediately sold the property, stone, and right to quarry the stone to a California businessman named L. H. Padgham, who retained Begg to be general manager.

The quarry began to expand its field of operations under the new ownership. The local newspaper reported that manager Begg made frequent and extended trips throughout the Southwest on business connected with stone contracts. A perceptive reporter in March of 1888 wrote that Begg had just returned from Southern California "looking as though he had enjoyed his visit." Indeed, he had. Begg had struck a major coup for the business: he had secured the contract to provide stone for the Los Angeles County Courthouse (Fig. 3).

As the first large-scale shipment of Moenkopi sandstone outside Arizona Territory, the Los Angeles County Courthouse contract marked the beginning of the boom period in Flagstaff's stone industry. And large scale it was: some 500 boxcar loads of the stone were to be shipped from the quarry to the building site over the course of the next two years. To prepare to process this volume of material, Padgham wrought many changes in his business. With associates Libby Hibben, W. H. English, and S. B. Hibben, Padgham formed the Arizona Sandstone Company, with corporate headquarters in Santa Ana, California. He appointed his brother, A. J. Padgham, a Southern California jeweler, to be company president. A capable businessman, A. J. Padgham further promoted the stone by exhibiting samples in trade centers throughout the West. The new president immediately hired 20 additional quarriers and traveled to Cincinnati to purchase state-of-the-art equipment for working the Flagstaff deposit. It may have been during his Ohio trip that Padgham became acquainted with a young Scottish quarryman who came highly recommend- ed by his recent employer, the Cleveland

Pat Stein is an historical archeologist living in Flagstaff, Arizona, and working for the Coconino National Forest. She became interested in Moenkopi sandstone while working for Janus Associates, Phoenix, on a National Register of Historic Places nomination for the Flagstaff Multiple Resource Area.
Stone Company. In late March of 1888, Padgham recruited the man, David Mitchell, to be operations manager of the Flagstaff quarry.

Mitchell was able to extract the stone systematically and in huge quantities, and it was under his management that the industry thrived. Megaliths as large as 36 by 16 by 12 feet and weighing as much as 730 tons were split from the deposit by means of explosive charges inserted in drill holes. Stoncutters then reduced the megaliths to blocks of 30 tons that were hoisted by either of the quarry's two steam derricks. During the peak period of the quarry, ca 1888 to 1910, the output was about four boxcars per day. The cost to clients ca 1897 was 35¢ per cubic foot for mill blocks "in promiscuous sizes", plus a sawing fee of 25¢ per cubic foot. In the 1890s, the stone industry ranked second only to the lumber industry in revenue generated for the town.

Mitchell's quarry provided not only a great quantity but also a high quality of the stone. Newspaper articles touted Arizona Red as a stonemason's dream:

"The stone is a beautiful...sandstone, rather soft when first taken from the quarry, but hardens upon exposure to the air. It has been sufficiently tested to show that it is one of the finest building stones ever found."

"Arizona sandstone resists a strain of 5,800 pounds to the square inch, which will stand the weight of the stone in a column over a mile high without crushing...Owing to its fine texture and to its being void of sharp grit, Arizona sandstone has very few equals for ease in working. It has no superior for fine carving, admitting of very heavy relief and presenting clean, sharp edges. It is without doubt the best sandstone in the United States for figure carving."

Given these attributes and Mitchell's capable management, stone from the Flagstaff quarry became a highly-prized construction material of the American West. A railroad spur connected the quarry to the Atlantic and Pacific Railroad (later the Santa Fe) track in Flagstaff, and thence to cities throughout the West. Among the many buildings to be constructed of Arizona Red were H. C. Brown's Palace Hotel in Denver, the N. T. Armijo Building in Albuquerque (Fig. 4), the Spreckels Mansion in San Francisco, the Oregonian Block in Portland, the Los Angeles City Hall, and the Sacramento Post Office.

Mitchell's work force, which numbered as many as 80 men, consisted largely of stoncutters from Scotland and England. A settlement the size of Flagstaff grew at the quarry, where workers lived with their families or resided in a boarding house for single men. Life at the quarry was punctuated by occasional tragedy, such as the 1894 death of a Nova Scotian and the 1908 injury of an Italian, both the result of falling rocks. In 1909 Mitchell himself was the victim of an industrial accident when a derrick gave way and caught him under it. Miraculously, Mitchell sustained only bruises and a broken leg, but the incident appears to have hastened his retirement. In 1910 the master quarryman, then 50 years old, left Flagstaff to turn full attention to his Buena Park, California, ranch.

The departure of David Mitchell marked the beginning of a period of decline for the Flagstaff sandstone industry. A crisis

precipitated in 1910 when some Los Angeles contractors were unable to pay the Arizona Sandstone Company for materials delivered, forcing the latter to take out a large loan. When creditors called the loan, due a year later, the stone company was unable to pay. The quarry changed hands twice in the following year before it was repurchased by its company president.

As the company faced financial difficulties, demand for the stone declined. There is some evidence to suggest that a California stone producers' bloc successfully lobbied against the import of non-native sandstone, hereby cutting one of the company's prime markets. And architectural styles were changing: the Romanesque buildings that had lent themselves so well to execution in cut red sandstone were no longer in vogue. The

**Introducing the DraftPro Plotter**

*Quality Graphics for Your Personal CAD System*

Hewlett-Packard offers the solution you (and your personal CAD system) have been waiting for ... the new HP DraftPro.

- Holds an 8-pen carousel for fiber-tip, refillable liquid-ink, and disposable liquid-ink pens.
- Compatible with IBM, Apple, and Hewlett-Packard computers.
- Supported by the leading software packages.
- Provides traditional HP quality, reliability, and service at an untraditional low price.

technology of poured concrete and concrete block construction had progressed to
the point where these materials could be
used far more economically than
Moenkopi sandstone.

After 1910 the main client for Flagstaff
sandstone became the Northern Arizona Normal School (now Northern Arizona
University, Flagstaff). Started in 1894 as a
reform school, the facility used Moenkopi
sandstone in the construction of its first
building, Old Main. Continued use of
sandstone in the twentieth century gave
the campus a unified architectural ap-
pearance. Today NAU North Campus con-
tains the largest assemblage of Moenkopi
sandstone buildings, its structures span-
ning the period 1894 to 1948 and represent-
ing a variety of architectural styles. NAU
also has the distinction of having the last
building to be constructed of Flagstaff
sandstone, the Science/Forestry Building,
erected in 1948.

The quarry saw little activity in the
1920s. A decade later, the Great Depres-
sion brought work there to a standstill. The
industry experienced a brief period of
hope, however, as work relief programs of
the 1930s were set in place. In 1935, the
Public Works Administration provided
funding for the construction of the Normal
School’s North Hall (Fig. 5), built of
Moenkopi sandstone. A second public
works program, however, took an unusual
course. When plans were announced in
1935 to build a Federal Building/Post Of-
Fice in Flagstaff, the original specifications
called for the structure to be a brick with a
partial facade of Indiana or Texas limestone. Congresswoman Isabella
Greenway and Senator Henry Ashurst saw
the project as a means to stimulate local in-
dustry, and pressured the government to
change the specs to allow bidders to
substitute Moenkopi sandstone for non-
native limestone in their proposals. The
government acquiesced, as use of local
materials could be expected to lower the
range of bids. The contract was awarded to
Robert McKee of El Paso, who subcontracted with an Illinois company to do the
stone work. The subcontractor found that
the most expedient way of obtaining
Moenkopi blocks at that time was to ship
them from a building that had recently
been razed: the Los Angeles County Cour-
house. In Flagstaff the salvaged blocks
were laid with their natural planes
oriented in the wrong direction. The rock
spalled and was replaced in the 1940s with
Coconino sandstone, which has a pinker
hue.

In 1938 the quarry and larger parcel in
which it lies were sold to J. Howard
Nickerson, a Cape Codder with speculative ventures in the West. Nicker-
son was joined a year later by his daughter,
Virginia and her husband, Joseph Reid.
Neither Nickerson nor the Reids were
quarriers, and their interest in the property
lay mainly in real estate development.
During the Second World War the Reids
donated the quarry equipment to the war
effort. The metal derricks, rails and other
stock were melted and recycled into ar-
maments.

In the last two decades, the extraction of
stone from the Flagstaff deposit has vir-
tually ceased. NAU bought stone several
years ago to repair the front steps of Old
Main. The last time rock was quarried was
in the late 1970s when the Santa Fe
Railroad shipped three carloads for repairs
at a Chicago station: the rock was used for
a bench in the ladies’ restroom of the
LaSalle Street Station.

The great stone industry that was once
so vital to Flagstaff’s economy is today
remembered by few local residents. To
those townsfolk who recall the quarry, still
fewer realize the extent of its architectural
legacy, that its rock traveled from the
grand ballroom of a club in Albuquerque
to the restroom of a Chicago train depot.
And, like Albuquerque’s Commercial Club
and N. T. Armijo buildings (demolished ca
1953 and 1969, respectively), the struc-
tures themselves are one by one falling vic-
tim to the bulldozer and wrecking ball,
one by one disappearing.

P.S.
