## Honor Award: Renovation

Yale-Burton Reservoir  
Albuquerque

An 8 million gallon reservoir located in East Albuquerque near a prominent entrance to the University of New Mexico. The project was as a consultant to an engineering firm doing a structural renovation of the reservoir. The structurally supporting berm was surfaced with boulders which provide immediate textural interest until plantings matured. A warm-tone concrete fascia replaced a chain link fence barrier. Sheltered reading and conversation areas were developed in the space adjacent.

### Jury Comments

We were impressed with the design assignment and believe the architect did an excellent job. The use of the reading and conversation areas was impressive and well done. The engineer is to be complimented who hired the architect for the aesthetics.
